BOTH THE OWNER and the Architect are particularly interested in all kinds of building materials, power and bear. of building materials, power and heating systems, building specialties, every accessory that goes into their project. Every issue of the Building and Industrial News contains hundreds of new building and construction reports giving the names and addresses of both the owner and the architects. Both the owner and architect receives a copy of the Building and Industrial News containing mention of their individual job conspicuously marked. Thus the builder and the architect have in their hands not only the news items of their particular project, but also the announcements and the advertisements of energetic business men who have goods to sell that are necessary to construct and equip the undertaking. IS YOUR ADVERTISEMENT AMONG THESE?

Catarrh Can Be Relieved

MERE IS NO NEED for you to continually suffer from Cat-arrh and Cold in the Head. It makes you miserable, doesn't it? You really don't care whether things go right or not and you wonder when you'll ever get over it. And you will not get over it until you get the Clover Leaf Catarrh Remedy, and use it. It will relieve you, and you'll wonder why you had not used it sooner. We are so positive that this will relieve you of your Catarrh or Cold in the Head, that we guarantee you satisfaction or we will refund your money.

"KINNEAR" The ONLY Door

You Buy for UTILITY that INCLUDES FIRE PROTECTION

INNEAR STEEL ROLLING DOORS are designed to afford fire protection and for the closure of all openings in which ease and speed of operation and economy of space are considerations. They are adaptable to all classes of new or old building construction and by their use make possible the closing of very large openings which could not otherwise be conveniently covered.

Recent great conflagrations have fully vindicated the claim of the "KINNEAR" STEEL ROLLING DOOR to pre-eminence as a fire-stop. Placed side by side with various other forms of fire retardants it has in every case remained in place even after the others were destroyed.

We will consider ourselves favored if allowed to explain and make quotations on any constructions meeting your definite needs.

We have just received from the press a new Handbook on Steel Rolling Doors and Shutters Illustrated only with California Installations. WOULD YOU LIKE A COPY?

Editorial Comment.

The outbreak of the incertifithe prisoners at Poisons and the murder of Mrs. Harbert at Sotckton by a paroided Japanese convict is likely to produce some reaction against the manufili sentiment that is now prevalent for the criminal minds are abnormal. It may be that all criminal minds are abnormal. It may be that it is a disease that should be treated in a hospital. But society owes its first duty to itself and the citizen who supports the laws of his hand, pays his debts and earns an honest living is the first to be considered.

Julian Hawthorne, the son of an ilinstrious father, used his name and the
United States mail to defraud the fellow citizens out of money by inv sting
in fly-up-the-creek stock concerns. As
a result he served some time in the
federal prison at Atlanta. Georgia.
Since then he had been filling space in
criticism of our prison methods and
prison officials. While the fare and the
treatment may have be end distasteful to
him it certainly is not a place, nor
should it be made a place, where
criminals want to return.

A criminal is one who wants to get the best of it all the time. No matter whether he be a high financier or a second story hurgiar he wants to get the rewards without honest labor. And he tries to beat the game. If the lonest citizen deat the way and gets robbed or killed so much the worse for the honest citizen. And this kind of criminal is the person whom Premont Older and has kind enlogize and devote more space to than to all the honest citizens in the country.

Privous are primarily places of punishment and they sometime effect reform. And while it is a bard thing to remove the stigma of prison life from those who really want to reform vet the first thing for suciety to do is to protect itself and that it can only do by providing some sort of punishment for the wrong doer.

Chata, Clark's hamboyant decleration that he is willing to go to war with England rather than permit her to interfere in this country's domestic affairs, and the general argument for 'hrotecting American interests' by permitting this country's constwise vessels to use the Panami Canal free of tolls, illustrates a curious error into which many people fall in considering questions of this sort. They ignore facts in a sort of hysteria of sentiment

The Panama tolls question involves an interpretation of a treaty on the one band, and on the other of a purely economic problem. Primarily free tolls for American constwise vessels means giving the use of a great public property to a few men who happen to own a certain class of ships. Whether this grantny is justified on the ground that it will be of general benefit through the reduction of transportation rates is cossly ascertainable by an analysis of facts, and cannot be decided by a false appear to patriotism.—Kansas City Star.

The May Dac Fete for San Francisco this year will consist of a celebration of the Exposition Grounds which will reveal the progress that has been made in the construction of the great fair and give some idea of what the completed Exposition will be.

And it will be a revelation to many of us. When times are dull and things book disuppointing it is a good thing to look back sometimes and see how far we have gone. And as this May Day selebration is to commemorate the final rebuilding of the city it will show in leview what has been accomplished during the last eight years.

A great deal is being putlished about the location of the regional banks and as might have been expected those cities that have lost are charging that political deals figured in the apportunitient. Such things were expected. But it is only fair to say that the relection of the cities that secured the location of these financial centers was made after due deliberation and a through combination of all claims:

Denver, for instance, objects and says that San Francisco is as foreign to it as San Francisco. And right here it would seem that the fact that Denver was not selected proves that no political consideration figured in the apportionment. For Missouri was allowed two regional banks, one at St. Louis and one at Kansas City, If politics had figured Missouri would ave been "taken care of" by the allotment of one bank. And further than that Colorado is represented by two Democratic Senators. So that while there are a lot of disappointed applicants the apportionment seems to have been made as fairly as it could have been.

Eirbhuuke Construction has now teached a very practical stage in the science districts of Italy, where all new fouldlings are being creeted under strict supervision with respect to their ability to resist earthquake shocks. Prof. Omori, the Japanese authorify, has estimated that 99.8 per cent of the detths in the great Messian earthquake of 1908 would have been prevented if the buildings had been propagation of the property constructed.—Scientific American.

The Making Of Composite Floors

By Robert P. Skinner.

The report on thousand of sawdust and magnesium chloride has given rise to innumerable inquiries from correspondents from vertious parts of the United States, all of whom express a desire for further details. It stated in the original report that extensive use was being made in Germany of a flooring composition consisting of a solution of chloride of magnesium to which pulverized magnesia is added together with consideralde proportions of sawdust, and which, skilfully compounded, provided being a relatively mexpensive and fairly fireproof material, especially useful in large office fouldings and public halls. time mounter stated that the art of laying these floorings in Germany is far alread of the practice in America, and asked particularly for the method of coloring the material and of governing its expansion and contraction,

According to my information there should be neither expansion or contraction of the material from any magnesium chlotade is once laid. very ingredients are such that there is no buckling or cracking due to heat or cold. In Hamburg the composition is mixed and spread where the building operations are being carried on, the prepared dry meal being delivered lags from the factory, and the lye water made on the spot. It is impossible to state the precise rule for the position of the meal or for the lye solution, these being the minufacturers' secrets and each manufacturer claiming particular merits for his own for-These formulas are not patented, and there is no doubt that they are all substantially alike. Several manufacturers have expressed a willingness to sell then process, either for the whole of the United States or for a restricted territory one Hamburg him sold its formu'i for a small piece in Southern Germany for \$1,128.

The mixture of meal and lye water is made in a mortar box and when a thickness of not more than 2 inches is promosed it is suread and smoother with a land trowel, when a thickness of 4 uncles is desired, the material is tumped and then smoothed. The amount of the water used in mixing the meal depends upon whether the flooring is to be simply spread or tamped; if spread the ordinary practice seems to be to use from 1 to 6 buckets of lye water to I sack of meal, the sack apcontaining from 50. 10 pound-

These floatings were first utilized in large other bindings in Humburg, and probably closwicte, as a basic floating for hundeum and also for the addition of artificial wood-marble floatings are substitutes for wood and the panels are poisible like hardwood floors; that is to say, smoothed with steel shavings and given a corting of way. When floadeum is applied, it is glued to the magnesim eiberde foundation with a lindeum cement, which is said to be composed of copal resion and putty In Germany Impleum is never tacked to wood or artificial stone flooring, as usual in the United States, but it is invariably glued in place, in ordinary floor paste being used when it is applied to wooden floor. Limbeum thus laid is washed afterwards with soupwater and when dry given a conting of wax, exactly like a hardwood floor. This treatment is the ordinary practice in the large office buildings of Germany, even in hallways where thousands of people pass in the course of a week.

The magnesium-chloride flooring was first considered a particularly excellent foundation for linoleum; and it is only in comparatively recent times that it has been found possible to color if and lay it so attractively that no linoleum covering is necessary. It is laid tight against the side walls making the entire floor waterproof. In both 100008 and around toilets at is brought to the edge of the porcelain and the joints are counded noward, so that no crevices present themselves in which dust or dirt can collect, nor should there be any joint through which water might percolate

The favor in which linoleum is held in this country is such that manufacturers of these new composition floorings have some difficulty in Inducing buyers to put down this material, in solid or varied colors, in preference to a similar natural color foundation with linoleum coverings, although the cost and wearing qualities of the former method are said to be much in itfavor, Lipoleum costs in Hamburg about 86 cents per square meter la square meter equals 1.2 square yards). and the cheapest class of magnesiumchloride foundation payement costs 48 cents, making a total of \$1.31 square meter against a cost of \$1.19 per square meter for a colored woodmarble floor attractively finished. The new floorings may now be obtained in almost any color, or in mottled colors When mottled colors are desired, the different colored mixtures are propared separately and tamped in together as the floor is laid. Special dyes are required for these operations. and there are a number of manufacturers who produce them. In a general way, from 15.4 to 22 pounds of color are necessary for 220 pounds of mor-(ar The proportions vary with strength of coloring desired. The colors themselves are of different prices. manufacturer quotes red, blue, black and brown at \$4.76 per 220 pounds, oxide green, \$53.55; and blue, \$19.01 to \$21.42 per 220 pounds. Another manufacturer quotes red dve, very much in demand at an average price of \$3.81 per 220 pounds. The prices again vary with the quantity ordered. The more delicate tints, such as green and blue, are more sensitive to light, particularly if exposed for a long time, than the the other colors, such as black, red and brown. Red is especially favored, and the many different shades are said to be absolutely unchangeable. Most of the manufacturers of these dyes supply

dyes for cement tiles, stucco, imitation murble, sand-lime brick and cement blocks.

One Hamburg manufacturer claims for his own composition that it is crack free under all circumstances, warm under foot, elastle and sound proof, preferable to linoleum, as linoleum curls at the edges after a time, breaks or wears away, and absorbs water, permitting it to leak through. This same manufacturer submits a certificate of examination from the royal board of examiners of material in the Technical High School in Berlin, reporting as follows on the examination of samples of his material:

 After the sample plates were soaked in water and had been exposed to frost 25 times at 15 degrees C, below zero, the samples remained unharmed.

2. After the plates had been lying in water for eight days a very small proportion of water 19 per cent) had been absorbed.

3. After the plates had been attached to a vessel containing water—after 21 hours, none; after 48 hours, 2 cubic centimeters, of 5 per cent; after 12 hours, 4 cubic centimeters, or 10 per cent, of moisture had been absorbed.

This manufacturer also claims that in this country his composition is cheaper than pine flooring, tiling stone, that it may be used to cover old worn-nut wood and stone plate floorings, staircases, and the like, without the necessity of removing the old floors. Wherever a foundation is firm and dry it may be laid without any complicated preparations. Finally, it may be cleaned with cold water and only very seldom should lukewarm water be applied. After complete cleansing and thorough drying, the flooring should be rubbed with raw linseed oil or should be waxed,

Magnesium chloride, the chief ingredient of these compositions, is worten, in 50-ten lots, in casks of 880 pounds (f. o. b. Hamburg, \$11.50 per ton fused. If in lesser lots, \$12 per ton. Greek calcined and powdered magnesite, in charrels of 30s to 440 pounds is worth \$33.32 to \$55.70 per 2.000 pounds f. o. b. Rotterdam. Raw magnesite. in casks, is worth \$30.90 per 2.00 pounds f. o. b. Hamburg.—From the Architect, Builder and Engineer.

PORTLAND CEMENT PRODUCTION.

The final figures for the Portland cement industry in 1913, as obtained by the United States Geological Survey on March 16, show a production of 92,097,-131 larrels, shipments of \$8,689,377 harrels and stocks on hand 11,220,328 barrels. It is somewhat interesting to compare these figures with the estimates made by the Geological Survey on January 15. These estimates were as follows: Production 92,406,000 barrels, shipments \$8,853,000 barrels and stocks on hand 11,375,000 barrels, the percentage of error ranging from only .003 in production to about .01 in stocks on hand.

Firms desiring news an special classes of buildings, such as Banks, Churches, Schools, Hotels, etc., will find such items all classified and grauped under proper headings, cammencing on this page. These same Items are again repeated under "LOCALATIES" in the last part at agr sews department.

APARTMENT HOUSES.

SAN FRANCISCO-Apartment house, 3 story and base, frame, \$20,000 Architects, Rousseau & Rousseau, Monadnock Bldg., S. F. Owners, Roussean Realty Co. The building will be precied at the southeast corner o f Page and Fillmore streets, covering an area of 30 by 81 feet. The building has been arranged for one store on the first floor besides the entrance to the apartments. Upper floors will be arranged for seven suites of two, three and four rooms. All apartments will have wall beds and private bath rooms. Interiors will be finished in pine and elm panels. Some oak floors will be used. There will be steam heat and a hot water system. Bath rooms will have composition floors and tile wainscot. Exterior of the building will be covered with brick vencer. Plans are complete and figures are being taken.

SAN FRANCISCO-Apartment house alterations, 3 story and base, frame, \$3,000. Architect, none. Owner. Patrick Lynch, 116 Hampshire street, S. F. This work will consist of the alteration of a two-story frame building at 571 Natoma street into a three-story apartment bouse. Suites will be of the two and three room type. There will be new interior trim, plumbing, electric work and plastering. The outside of the building will be covered with rustic and shiplap. Plans are in the hands of the owner and work will

be done by Day Labor.

SAN FRANCISCO-Apartment house. 4 story and base, reinforced concrete. \$30,000. Architect, T. Patterson, 310 California street, S. F. Owner, S. Zussman. The building will be erected on the north side of Post street west of Larkin. There will be a number of two and three room suites, all of which will have private baths and wall beds. Interior finish will be of pine and redwood with some elm panels and oak floors. Plans provide for steam heat and a hot water supply, An automatic elevator will be installed. Bath rooms will have tile wainscot and composition floors. ECv. terior of the building will be faced with cement plaster. Plans are complete and a contract will be awarded shortly

SAN FRANCISCO - Apartment houses, 2, 3 story and base, frame, \$12,-000 each. Architect, none. Owner, J. Sockolov, 1857 O'Farrell street S. F These two buildings will be exerted on adjoining property on the north side of California street east of Broderick and will cover an area of 10 by 122 feet. The two buildings will contain a total of 12 suites of three and four rooms. Interior finish will be of pine and elm panels with beam ceilings and some hardwood floors. There will be steam heat and a hot water supply. Bath rooms will have tile wainscot floors. All and composition anart. ments will be enipped with wall beds. Exteriors of the buildings will be covered with rustic and cement pluster on metal lath. Plans are complete and in the hands of the owner who will do the work by Day Labor

SAN FRANCISCO-Apartment house, 3 story and base, frame, \$10,000, Architect, Paul De Martini, 2122 Powell street, S. F. Owner, G. Romano building will be creeted on Pacific street, near Taylor, and will contain six suites of two and three rooms Interior will be finished in page and redwood. There will be wall heds and private baths. Plans also provide for a hot water system. Bath rooms will have tile wainscut and composition floors - Exterior of the building will be covered with rement plaster metal lath. Plans are complete and figures are being taken. Bids will close in one week

SAN FRANCISCO-Apartment house, 3 story and base, frame, \$15,000, Architect, none Owner, E. M. Fritz, 1401 The building Masonie avenue, S. F. will be erected at the northeast corner of Frederick and Delmar streets, covering an area of 29 by 105 feet. Interior has been arranged for a total of eleven suites of two, three and four rooms. All interner finish will be of pune and hardwood. Suites will have private bath rooms and wall beds Plans provide for steam heat and a hot water supply. Bath rooms will have composition floors and tile wainscot. Portable vacuum cleaners will be installed. Exterior of the house will be covered with cement plaster on metal latti. A klinker brick base is also specified Plans are complete and work will be done by Day Labor. materials are now being purchased.

OAKLAND, CAL,-Apartment house furnishings, fixtures etc. Cost not stated. Architect, Clay N. Burrell, Albany Bldg., Oakland, Owners, Sommarstrom Bros. The three-story frame apartment house at the corner of 16th and Alice streets is nearing completion, and the owners will shorth award contracts for furnishing, store fixtures, lighting fixtures etc. Marble and tile work are now being figured.

SACRAMENTO, CAL, - Apartment ouse alteration, 3 story and base brick, \$20,000. Architect. J. Seadler, Forum Bldg. Sacramento, Owner's name withheld. The work will consist of both interior and exterior alteration. Included in the work will be new interior partitions, plastering, mill work and carpenter work, electric work, plumbing and painting. Patent store fronts will be used, Exterior will be faced with pressed brick. The apartments will all have wall beds and private baths. Bath rooms will lave tile wainscot and composition floors. GOVERNMENT ARCHITECTURE SINCE THE TARSNEY ACT.

Need of Additional Architectural Service and Proposed Methods for Securing II.

John Ball Rankin."

*Arcortect Philadelphia, Pa. Chairman of the committee on government architecture. Associated with him were J. I. Mauran, M. B. Medary, Jr. Egerton Swartout, Breck Trowbridge and Walter Cook, es-officio.

The government at the close of 1912 was left through the repeal of the Tarsney act, without any means of procuring architectural service outside of the office of the supervising architect of the Treasury and such other bureaus for the preparation of plans as are maintained by other departments. beyond some isolated instances where authority to make other arrangements had been attached by Congress to authorizations for public buildings. There was much difference of opinion in the profession as to what should be done to clange this condition, some advorating a bureau of fine arts; others a national board of works, while many advised the enactment of a law similar to but more comprehensive than the Tarsney act, while others felt that the certainty of intolerable conditions which would soon confront the government, made it desirable for the Institute to take advantage of the wave of discontent that this state of affairs

OTTO SCHRADER, President

OTTO R. SCHRADER, Secretary

STRUCTURAL STEEL CONTRACTORS

Works at HARRISON ST., bet. 8th & 9th

Telephone Market 337

San Francisco

must means by we use shoul. As It turned out, members of Congress attending the extra coston found upon inquiry and investigation, that the supervising architects office was not in position to take up any now work for several years. This readed a general demand in Congress for some sort of action. Various memors of the Institute reported the two tounds, when discussing the question with members of Congress that turne was a latent sentiment of great discussing the could be brought to a focus beling the could be brought to a focus.

Congressional tummittee on Buildings.

That a general to line exists in Congress that the viole public harding question is in workfold shape is indicated by a proving in the public bulldings fill approved March 4 (1915, which is as follows:

"A commission composed of the Secretary of the Treasury the Postmaster General, the Attenney General, two to be appointed on the President of the Senate and two men ers of the bouldings and committee on public grounds of the House of Representatives, to be appointed by the Speaker of the House shall wit the aid of the supervising at our tof the Treasury, present to Congress a connected tions for the construction and comfore authorized with a reasonable time, and shall frame a standard or standands by which the size and cost of publandings shall as for as practicable be determined, and scalt report as to the adaptability in size, accummodations and cost of buildings bitherto authorized to the requirements of the communities in which fley are to be located and also whether the existing appropriations should be increased or diminished to meet such requirements

From this it would seem that the United States, which states which has under way and in contemplation more buildings and than any other government in than any other government in to this work and without definite on the layer gearding what is to be an important part of the enduring evidences.

of the taste and entityation of our time. It is to be looped that the comission just referred to consisting entirely of government officials and employees, may seek the advice and counsel of the profession for Wace work it is charged with the responsibility of preparing a counseled so non-feel so non-feel so non-feel so counseled.

There are a number of courses which the Institute may follow in order to assist in getting the question of government architecture placed on a base commensurate with its importance, it being assumed at the outset that the fustime owes it to takef and to the government to take the initiative in a mitter so directly involving its axis and dieds. These may be briefly outlined as follows:

First—Conditions being so generally institisfactory to Congress Bedf we may condidentally awart results with the certainty E it some action will be taken by the government in the meritatine, free from any responsibility concerning weatover measure of refer may be declad upon. It seems so downests the duty of the historial beginning as well be rejected as unworthy of serious consideration.

time airts of a board of works, or a busrean of acts and fouldings under which all government expenditures for ail in any form may be handled Las most the minds of those interested in anchitecture and other arts. Legislation leading to the establishment of such a department, that would have jurisdiction over all buildings sculpture. objects of art, and all works involving these ias been the dream of many of our most earnest members, and it has many advantages. It would immement architecture and related arts in a position of great importance and ould perhaps enable many things to be done properly which are now done in a slip-stod and slovenly way. On the other hand there are objections to such a plan which might delay indefinitely its enactments into law would be apposed by all departments of the government for the reason that no department desires to relinquish central of its work to another department. Its adoption would probably

mean that all government architecture must necessarily be put on a competitive basis because no other arrangement seems possible for work of such volume as that now conducted under the supervision of the Treasury Department and it would be difficult or impossible to make distinctions. As it now stands, any government department, except the Treasury Department, can employ architects by direct selection, and it is a question whether the Institute should advocate a measure that would make it impossible for the government to employ private arenitects except by competition. The drafting of a full to create a department such as would be necessary to take care of all this work, would be a task of great difficulty and could only be done properly with the assistance of tre best legal and legislative experieace, after considerable study and research. Therefore, while this plan has much merit, and while its consummation at some future time is to be looked forward to, the institute should carefully consider whether it covers the needs of the immediate future.

Third-The Tarsney act proved to be a workable law, and there appears no reason why a similar law with some slight but important modifications. would not be entirely practical and satisfactory as far as the Treasury Denartment work is concerned, for the near future at least. The enactment of such a law giving the additional authority to the Secretary of the Treasmry to employ juries in each competifion, to pay fees to competitors and juries, requiring him to apply it to all buildings above a certain cost and to conduct the competitions and pay the successful architects in accordance with the best practice, may well be considered as a relief from present conditions, while further thought could in the meantime be given to the designing of a plan and working out the details of a proposed department of tine arts.

Wiether such a bill could pass Congress as at present constituted is not now certain. A bill was drafted by the committee during the present year, not for introduction for pasage, but at the request of a member of Congress to enable bin to make a canvass of the House—From Pacific Builder and Ensineer

BOTH THE OWNER and the Architect are particularly interested in all kinds of building materials, power and heating systems, building specialties, every accessory that goes into their project. Every issue of the Building and Industrial News contains hundreds of new building and construction reports giving the names and addresses of both the owner and the architects. Both the owner and architect receives a copy of the Building and Industrial News containing mention of their individual job conspicuously marked. Thus the builder and the architect have in their hands not only the news items of their particular project, but also the announcements and the advertisements of energetic business men who have goods to sell that are necessary to construct and equip the undertaking. CALL Douglas 2944

The Hotel is only as good as its service

The new Ritz-Carlton Hotel, in Philadelphia, has four Electric Elevators and six Electric Dumbwaiters, furnished by the Otis Elevator Company.

ARCHITECT Horace Trumbauer

Other Hotels of the Ritz-Carlton chain which are Otis equipped---The Ritz-Carlton,

New York

The Ritz-Carlton,

Montreal

The Plaza, Buenos Aires Grand Hotel et de la Plage Guaruja, near Santos, Brazil

The Carlton, London The Ritz, London The Hyde Park, London The Ritz, Paris And its service can be only as good as its elevators----which is one good reason why hostelries with reputations to maintain, like the latest link in the Ritz-Carlton chain, at Philadelphia, have

Otis Elevators

Choosing from the various Otis machines, the Architects can provide hotels with elevators of the type called for by the character of the structure and insure perfect service---can equip all buildings of all classes in accordance with their needs.

Give a building unsatisfactory elevator service, and its other excellence can not overcome the handicap. Our offices in ninety-one cities in the United States are always at the Architect's call and can assist you in making your elevator—specifications—100 per cent correct.

OTIS ELEVATOR COMPANY

Stockton, North Point and Beach Sts.
San Francisco

Offices in all Principal Cities of the World.

OFFICE PACIFIC TEL. & TEL. CO. Basement walls 22 ft. high. Cement plastered on inside against severe water pressure. Plaster water-proofed with imperial Water Proofing.

METCALF HOTEL, Geary nr Taylor. Righetti & Headman, Architects. Interior walls dampprofed with Imperial Damp Proofing. Exterior walls waterproofed with Imperial Water Proofing. Color effects with Imperial Pigments.

"Drouve" Straight-Push Window Operat-

"Drouve" Anti-Pluvius Skylights.

"Grant" Pulleys, Pivot Lifts and Casement Devices.

"Turner" Drawer Sildes.

"Home" Safety Window Guards.

"Merritt" Steel Lockers and Shelving-For Garages, Schools, Gymnasiums, etc.

"Phoenix" Sanitary Metal Tile — For Bathrooms, Kitchens, etc.

"American" Rotary Vacuum Cleaning Plants-For Office Buildings, Residences,

"Hill" Clothes Dryers-For Yards, Balconies and Roofs.

"Hustler" Ash Sifters-Save Coal.

"The Window" Coal Chute—Ornamental and Necessary.

Asbestos Theatre Curtains.

"Beaver Board",—The Superior Modern Wallboard.

"Cabot's" Deafening and Sheathing "Quilt."

Building Papers, Deadening Felts, etc., of all kinds

"All-Metal" Doors, Windows and Trim.

"Liquid Stone", The Paint Eternal.

"Wainright" Concrete Curb and Corner bar.

"Graphilatum" for Roofs.

"Herringbone" Expanded Steel and Ingot lron Lath

"Hannon", "Hub" and "Goodwin" Metal Corner Bead

"Best's" Keene's Cement—For Gauging Plaster and Finishing.

"Caenstone" Cement—For Making Artificial Caen-Stone.

"Victoria" Keene's Cement (Imported) For Artificial Marble and Tile.

"La Farge" Non-Staining Cement.

"Cabot's" Mortar Color Pulps.

"Ebco" Curb Bar—For Edges of Cement Curbs, Stairs, etc

"Whalebone" and "Crimped" Metal Wall-Ties.

"Rutty" Metal Wall Plugs

"Hercules" Waterproofing Cement Compounds.

"Cabot's" Mortar Color Pulps.

"Cabot's" Creosote Shingle Stains.

"Cabot's" Cement and Brick Waterproofing Stains.

"Cabot's" "Conservo" Wood Preservative.

"Con-ser-tex" Canvas Roofing — For Sleeping Porches and Decks.

"Rubber-Mica" Ready Roofing.

The Ruberoid Roofing.

"Reytile" Rubber Shingles.

"Diamond" Ball bearing Door Hangers.

"Metalcrete" concrete Hardner.

"lronite" concrete Hardner.

Wood rolling doors and partitions.

Venitian Blinds.

"White Honse" Kitchen Furniture.

A number of new agencies will shortly be added to the above list.

Editorial Comment.

Building construction for the month of March went along at about an even pace compared with the same month of last year. For San Francisco the figures amounted to just about 31/2 millions and the figures for last year amounted to about the same sum. To be accurate the total for the month of March, 1914, amounted to \$3,507,763, while the figures for the same month last year reached \$3,576,376.

Separating the figures of last month into different headings the following figures represent the amount of construction: Brick and concrete, \$1,974 .-469; frame, \$722,374; alterations and additions, \$137,202, Total for private construction \$2,834,045. To this is added the Panama-Pacific contracts, \$140,964, City construction-Municipal Rail Road \$268,511, and stretts and sewers, \$41.-806-: State work, \$220,187; U. S. Government, \$2,250 making a grand total of \$3,507,763.

The figures for San Francisco compare with the general condition throughout the country. Reports from about 75 different cities throughout the country, made to the American Contractor, Chicago, show a slight galn over last year. But the gain is so slight that it is hardly more than would be expected from the natural growth of the country and the increase of population. The following is a comparative table:

PRODUCTION OF ALUMINUM ORE IN 1913.

The demand for aluminum in the United States in 1913 showed a steady and rapid growth, according to W. C Phalen of the United States Geological Survey. This resulted in a marked increase in the production of bauxite or aluminum ore, the output of which, acconding to final survey figures, 210,241 long tons, valued at \$997,698, an increase of 50,376 long tons, or 31.5 per cent and \$228,766 or 29.8 per cent respectively, over the figures for 1912. This growth of the aluminum industry has been marked by health expansion and improvements in existing plants, the commencement of work at a new plant in the spring of 1914 and progtess in the work on new power sites where largely increased hydro-electric power for use in the reduction of the metal will be in operation during the next few years

Manufacture and Application of Paints.

An Interesting Paper on Some Important Phases of House Decoration.

From the Western Canada Contractor, An interesting and institute paper on points and treat applications was read before a recent meeting of the Vancouver bounds of the British Columbia Society of Architects by H. H. Welde, board manager of the British American Paint Company, Vancouver, who is recognized in British Columbia as an authority on matters pertaining to this subject of manager of the properties of corroded white lead under the heading of "Figure 11st for subject of corroded white lead under the

being as follows "Corroded waite lead (defined basic carbonate of leads is really a combination of hydrated lead oxide with lead carbonate in the proportions of one of the former to two of the latter. though these proportions are varied extremely. A throatically correct composition of white lead is very dense and opaque, and is quite white, though not so whote as oxide of zinc and any excess of either chemical constituent impairs its color and quality, There are several methods of corroding lead. The oldest, and perhaps the hest, is the old Dutch or 'Stack' pro-The metallic lead is melted, cast into perforated discs or buckles, about six inches in diameter, which are put in earthen nots containing about pint of vinegar or dilute acetic acid. These are placed in rooms holding several layers of many hundred nots The nots are covered with heards and layers of spent tan back, or horse dung, are placed between each layer of pots. The rooms or stacks are kept closed for about one bundred days, during which period the heat and carbonic acid, generated by the fermentation of the spent tan back with the acid vapors, combine to corrode the lead into a flaky white substance. After this is crushed, screened, floated, washed in water and dried-the result being the white lead of commerce which is afterwards ground in raw or refined linseed oil and sold for general mainting nurmoses

"Another process of manufacture is the Cylinder' or quick process: In this metho? the molten local is blown into fine granules by steam. The fine, powdered lead is put into large, slowly resolving wooden cylinders, moistened with ditter acete acid, then for several days subsected to the action of air and corbonic acid derived from burning coke. It then goes through much the same process of grinding, washing, etc., as in the old Dutch process. The resultant corroded lead also is chemically very similar to the stack or old Intel lead.

"A third method is the Dahl process, which consists in slowly pouring the molten lead into cold water, thus reduced in the process of the molten lead into cold water, thus reduced the process of the pr

itating the lead in the form of basic carbonate. Lead corrolled by this price cerebrate, carbonate, Lead corrolled by this price ceess is finer and winter and takes upon more oil in griading than one other basic corrolled leads, but lacks the dense apacity of corrolled lead. There are other processes of obtaining winter lead, but these are the methods generally used spensarily considerable for them.

The outstanding characteristics of basic carbonate white lead are. It is very opaque; indeed it is one of the most opaque of all white pigmentsthis being largely due to the small quantity of oil needed to reduce it to painting consistency. But, on the other hand, its spreading power is correspondingly small because the lead hydrate contained in it unites with the linseed oil to form a lead some. which, while beloing it to brush out reduces its durability. In our cities, where sulphurated hydrogen gas is almost universally present, thus kind of paint changes con exposure) into black sulphide of lead. This is why pure white lead seldom retains its original color. White lead is a valuable and useful pigment on account of its opacity and working qualities, yet it is a treacherous one on account of its deficient durability and sensitiveness to atmospheric conditions. After one or two years good white lead paints will begin to disintegrate on the surface and wear off in the form of a white powder.

"A mixture of 40 per cent zinc and 60 per cent lead is more durable than pure white lead. A small percentage of inert pigments added to lead and zine has been proven by the Master Painters' Association, working in conjunction with the United States Government, to be far superior to either pure white lead or pure white zine The results of exhaustive tests in different parts of the United States have upset the old theory that pure lead and linseed oil is the best paint Based on these and other tests is my reason for advocating the use of ready mixed paints. Most of the leading naunt manufacturers of mixed paints are now making their paints on the formulas which have proven more durable than pure white lead and linseen

Objections of Painters to Mixed Paints,

"The painter is loath to use anything but lead and oll, claiming it is better because he knows what is in it I venture to say that not one painter in one hundred has ever taken the trouble to test out paints made with other pigments and watch their results as compared with pure lead Another reason why the painter dislikes mixed paint is that it is a little harder to brush out than his paint. He wants a paint that will spread easily, and makes it with this end in view often sacrificing the quality of the paint to make it easy to apply.

"As to the vehicle it is conveded by all paint authorities that of all the drying oils, linseed or hax seed oil is the most trustworthy and is, in fact, the life of the paint. The purity of the linseed oil used is of the utmost importance. This oil is often sold in an adulterated form, the common adulterants being rosin oil petroleum oil and fish oil. Petroleum oil has no virtue, except as a cheap adulterant, Rosin oil will cause the paint to become brittle and chip off, while fish oil never thoroughly dries, and is always tacky when the surface is exposed to the sun, thus collecting any flying dirt and grit that may come its way. Linseed oil is sold in two forms; taw and boiled. The raw is just as it comes from the crushed seed. On account of natural moisture in our humid atmosphere, it dries too slowly unless there is an excess of dryers added, The dryers do not improve the paint. In view of this fact, I would recommend boiled oil for all outside work. that is if the oil is properly boiled.

"In regard to the builing of oil, you are largely at the mercy of the manuscular bacturers. There are several methods of building, a prevailing one is what is called 'bung hole building,' which is a pernicious practice, as no good hasting but can result. Another method is to boil the raw oil with rosin dryers. This also is only a substitute, and has nothing to recommend it, except its cheapness. It leaves the builed oil a very light amber color.

"One of the hest methods is to boil

the oil at a sufficient heat to evaporste all the moisture, and add nothing but such drivers as red lead and oxide of manganese. By this method you can get a paint vehicle which allows the perfect oxidation and drying of the paint

"The oxblation of paint is of the atmost importance because the absorption of oxygen by the linsed oil eninely changes it from a fluid to the lough, leathery coating so necessary for purposes of preservation. In this process of oxidation the linsed oil gains in weight about 16 per cent.

"The life of a good paint will vary, but should not be less than three vears. Atmospheric conditions and exposures to various chemical gashave much to do in determining its durability. All new work should not be three coats, namely, primer, intermediate and misking coat.

Methods of Application of Paints.

"Never use a cheap primer. It is a common error that yellow othre and oil make the correct primer. This is not the case, especially when the dry orbre is mixed by hand, since all dry colors are much bulkier in the dry state than when properly ground and combined with oil, so that when the hand mixture is combined without without pressure, the outside particles only are coaled with the oil, and when the paint is applied to the surface, the wood, having a greater attraction for the oil than the pigment, absorbs the oil alone, thus leaving a dry, norons application to which subsequent coats cannot successfully bind themselves, Never prime over a wet or damp surface as it is bound to blister; this

bilistering is caused by heat vaporizing the underlying moiston. The paint then becomes brittle and scales off. Before applying the second coat be sure the first one is bone duy. This coat should not be too city or it will coat should not be too city or it will coate the finishing coat to crack, peel and flatten. Where light shodes are used for trimming, better results will be obtained by applying the trimming color on both the middle and finishing coats.

"The finishing coat should never be applied when there are indications of arin, or late in the evening in cold weather, as if it is, the fog will attack it, causing the paint to dry dat or without lastre. This coat should lastre practically no turpentine in it, and should be well brushed out, not thowed on.

Some Notes on Stalus and Varuishes "Creosote stains for shingles have been very popular for a number of years, but the leading manufacturers of stains and paints who have given this question serious consideration by exhaustive tests, have come to the conclusion that creosote, while a good wood preserver, is a poor binder for the pigments used in making stain, Creosote is very penetrating, with the result that the vehicle penetrates into the cedar and leaves the coloring motter on the surface with no binder to hold it on. Creosote made from wood is far superior to creosote made from coal; the latter creosote contains so much coal tar acid that it bleaches and destroys the colors. The coal tar acid attacks the chemicals used in the manufacture of greens, yellows and blues, thereby changing the color almost as soon as they are applied. An oil stain made of linseed oil with sufficient penetrating thinners, give- the hest results. The linseed oil binds the coloring matter on the shingles and prevents it washing off Furthermore, linseed oil has no chemical action on any of the pigments,

Varnishes are made from treated gums, rosin, linseed oil, chine wood oil, and turpentine or benzine, according to the purpose for which the varnish is required and the price at which it is sold. The gums are produced from South America, the islands of the Pacific, India and New Zealand, Kauri gum is one of the high grade gums and comes from the latter country. Most of the high grade varnishes are made from this gum on account of its hardness and durability. It is dug from the ground, where at some earlier time forests have stood. The gum is found in pockets just as it has run from the tree years ago. The older the gum, the better it is for vannish making; also the condition, color and freedom from dirt regulates its value and price. After being mined, it is scraped, cleaned and sorted, then shipped to New York or London, From these centers it is distributed to the varnish makers of the world. Large quantities, however, are now being shipped direct to the western states and British Columbia. The complicated process of varnish making with its different grades, would be difficult to describe, but the fundamental fact stands out, that one cannot produce good varnish from cheap or poor gums. Suffice it to say that in the better varnishes, the gums are melted in kettles over open fires, the oils

added, and cooked at different temperatures, according to the varnish that is being nade, the turpenture loing added after the boiling is done and before the varnish cooks. It is then packed away for a long period of time to settle out and properly nature Good varnish, tike good wine, improves with age.

The cheaper furniture variable and gloss oils are made in somewhat the same way, only rosin is used instead of gum, much less oil, and bonzine in lieu of turpentine These cheap varnishes should never be used on good work, as they are brittle easily scratched, and are fit only to be used as a size on plaster for kalsomining. A good varnish size should contain no rosin and very little gum, the lime or hard wall finish absorbs the thin oil and leaves nothing but the gum or rosin, with the result that it has no binder, consequently it does not make a good ground or surface on which to apply kalsomine or wall tinish. A good priming size for walls should be made almost entirely of linseed of China wood oil varnish. The Wall absorbs considerable of the thinners, but leaves a tough oil varnish on which to apply either paint, wall finish or kalsomine.

A good foundation on which to apply that finish is to apply a coat of shellar, one coat of good gloss or interior varnish, then one coat of flat finish. This gives better results than a coat of shellar and two coats of flat finish. The question of decoration for the plastered walls is attracting much attention at the present time, and most of the large paint manufacturers are making a flat oil paint with more or less success.

"The old fashioned kalsomine, made of glue and whiting, is fast being replaced by the more modern washable wall finishes These wall usually contain no lead, are therefore non-poisonous, dry hard with the same dull effect and can be washed. Kalsomine, as soon as the glue has perished, has to be washed off and re-The cost of washing off the old kalsomine is as much as that of applying another coat. I predict that in a few years the new wall finishes will almost universally supercede kalsomine.

PLANS WANTED.

Supervising Architect W. D. Coates Rowell Bidg. Fresno, Cal., states that plans for the first of Fresno's new schools will be called for shortly. He is now engaged in preparing a schedule which will put all competitors on an even footing. The first of the new buildings to be erected will cost in the neighborhood of \$150,000. The Board of Education are reported as being greatly in favor of securing plans from Fresno architects if possible.

Visalia, California, is to have a new school building costing in the neligiborizon of \$25,500. The Board of Supervisors have approved a bond issue of that amount for the Tipton listrict A smaller issue for the Manzanillo fistict was also approved by the Supervisors. Competitive plans will prohably be called for both buildings.

The Board of Education at Petaluma, Callfornia, has adopted a resolution atting for a special etection which is bedd on May 17th at which time to exple will vote on a bond issue of \$\frac{2}{3}\$ com for the construction of a new seed building. Schools are bandy seed building. Schools are bandy receiveded, and from reports there expects to be little or no opposition to the bonds. Competitive plans will be called.

W. T. Glies, supreme secretary of the Record Order of Moose, has reported to the committee as favoring Theoson, Attacha, as a suitable site for the orders proposed \$1,000,000 sanitarium for the treatment of thierculosis. Mr. siles has recently visited Theoson and the stocial committee in charge of the prioret will make a final trip of inspection within a short time. No plans for the building have been secured and architects interested should take the matter up with Mr. Glies.

Financing of the proposed \$110,000 cm in building in Sacramento, California, has been put into the hands of two committees, both of which report two committees, both of which report is to be an eight-story building, and will be erected on 7th street between I and J streets. A Bounheim and Albert Eikus are the committee appointed to seeme a \$100,000 boan, while b, W. Carunchael and D, S. Waserman are setting in touch with prospective tenants. Architectural plans have not been secured.

RAILWAY ACCIDENTS.

Resistance by the Southern Pacific Railway Company to the workmen's compensation act will not bring it any proble sympathy. At best, the contemion that it is an interstate and not a local corporation, is a purely technical question, one that will not be of long awaif with the expected improvement of notional liability laws. No matter what administration is in power at Washington, Hability lews, also much like that now in operation in California cannot be very far off.

The justice of workmen's compensation is seen easiest, both from the employer's and employe's point of view, in the railroad business. Not only is e hazard more directly connected with the occupation there than anywhere else, but the employer can in this case better protect itself by shifting the load, than in any other occupa-The expense of employer's insmance is a feature of railroad expense that would be most readily recognized. The company will add the cost to its regular operating expenses, and the public will pay, in the long run, for the accidents of the railroad employes through passenger fares and freightage costs .- Fresno Reunblican.

ELEVATORS USED BY THE ANCIENTS.

According to archaeologists, elevators were used in the imperial palace at Rome 2,000 years ago, probably operated by slave power

The highest building in the United States is the towerfor wireless to 211, pby that has just been finished on the New Jersey coast. It is 825 feet high and only 20 feet in diameter, It feet higher than the Woodworth build ag in New York.

as Banks. Firms desiring news an special classes of buildings, such Charches, Schools, Hotels, etc., will fad note items all classified sad grapped under proper headlage, cammencing un this page. These sums Items are again repented under "LOCALATIES" in the last part of one news department.

APARTMENT HOUSES.

SAN FRANCISCO - Aprotment house. 1 story and has black and steel, \$70,-110 Sutter street, S. F. Cowner, Emannel Levy, 717 Market storet S. F. building will be ere ted on Van Ness avenue near Vallejo and will cover a considerable ground area Apartments will consist of five and six rooms with from one to two private baths. Intetiors will be handsomely finished in pine and hardwoods with some oak floors. There will be steam heat, elevator service a vacuum cleaning system and hot water supply. All bath rooms will have tile floors and wainscot Wall heds are specified. Enin tile and marble. Exterior of the hurlding will be faced with pressed blick Plans are being prepared.

SAN FRANCISCO-Apartment house. a story and base frame. Cost not stated Architect none Owner, A. C. Lomelino 1705 Hyde street, S. F. The building will contain six apartments of four rooms each, and will be erected on the north side of Pacific street west of Hyde. Interior finish will be of pine throughout. There will be a hot water supply wall heds and private bath rooms Entrance will be finished in marble and tile Bath rooms will have tile wainscot and composition tloors. Exterior of the building will be covered with cement plaster on metal lath. Plans are complete and in the hands of the owner who will do the work by Day Labor.

SAN FRANCISCO-Apartment house. 3 story and base frame, \$20,000, Architect, Carl Gerifuss 46 Kearny street, S. F. Owner L. A Bactrocco. The building will be exceted on Vallejo street near Van Ness avenue. The building will have a frontage of 30 feet I inch by a depth of 122% feet. There will be a total of nine apartments each of tour rooms. All rooms will have outside exposures and will receive an abundance of sunlight and fresh air. Each apartment will have a reception ball from which all rooms except the baths may be entered. All rooms are exceptionally large and will be handsomely unished in pine with hardwood panels, beam reilings, builtin book cases and hardwood floors. Plans provide for steam heat and a hot water system. Bath rooms will have tile warnscot and composition floors. Kitchens will be equipped with all modern improvements, including patent itoning localds, coolers and chests. The building will be entered from the sidewalk level, the entrance and lobby being finished in marble and tile. Basement will contain private storage space for each apartment. amusement room and furnace laundry. room. Exterior will be covered with cement plaster on metal lath.

SAN FRANCISCO-Apartment house. 4 story and base reinforced concrete. \$32,000. Architects Rousseau & Roussean, Monadrack Bilde, S. F. Owners, E. V. Jacoy and J. B. Reite. The build—stay and base, brick, \$50,000. Arching will be erected on the south side of teets. Walter & White, 1626 4th avenue,

Post street 90 feet west of Lankin having a frontage of 25 feet and a depth of 120 feet. Interior has been arranged for a total of 27 states of two and three rooms with private baths and wall beds. Pine and hardwood trim will be used. Plans provide for steam heat, elevator service and a hot water supply. TALLEST CHIMNEY IS IN ARIZONA.

The tallest steel stack in the world is now building at Jerome, Ariz., as part of the new works there of the United Verde Copper Company. The chimney is 30 feet in diameter inside the brick lining, 30 feet 91/2 inches inside of the steel shell and 400 feet 1 inch from top of foundation to top of In comparison it may be stated that Liberty statue, in New York harbor, from bottom of pedestal to torch, 305 feet in height, whereas the statue proper is only 151 feet. The ppusual size of this structure, the connections for three flues, and the protection of the steel plate from the flue gases caused several interesting proolems in the design

The diameter and height of the climney were determined by the draft calculations, the diameter and height of bell were made one-eighth of the height of the clumney, or 50 feet. The bright cular angles riveted to the inside of shell and spaced 15 feet apart. Py this method the hearing capacity of the brick is not exceeded and any section can be replaced without affecting the others.

The wind load was assumed to be 50 months per square foot on the projected diameter, equal to 170 pounds per foot of the dead load was taken as the actual weight of steel plus the weight of brick lining, assumed at 112 pounds per cubic foot.—Engineering and Mining Journal.

BOTH THE OWNER and the Architect are particularly interested in all kinds of building materials, power and heating systems, building specialties, every accessory that goes into their project. Every issue of the Building and Industrial News contains hundreds of new building and construction reports giving the names and addresses of both the owner and the architects. Both the owner and architect receives a copy of the Building and Industrial News containing mention of their individual job conspicuously marked. Thus the builder and the architect have in their hands not only the news items of their particular project, but also the announcements and the advertisements of energetic business men who have goods to sell that are necessary to construct and equip the undertaking. IS YOUR ADVERTISEMENT AMONG THESE?

Catarrh Can Be Relieved

THERE IS NO NEED for you to centinually suffer from Catarrh and Cold in the Head. It makes you miserable, doesn't it? The Ritz. Paris

And its service can be only as good as its elevators—which is one good reason why hostelries with reputations to maintain, like the latest link in the Ritz-Carlton chain, at Philadelphia, have

Otis Elevators

Choosing from the various Otis machines, the Architects can provide hotels with elevators of the type called for by the character of the structure and insure perfect service---can equip all buildings of all classes in accordance with their needs.

Give a building unsatisfactory elevator service, and its other excellence can not overcome the handicap. Our offices in ninety-one eities in the United States are always at the Architect's call and can assist you in making your elevator—specifications—100—per cent correct.

Editorial Comment.

The battle ships and colliers steaming out of the Bay of San Francisco on the errand of war reminds us that after all the human race is much unchanged since the world began. That the law of might still obtains in the final unalysis and that civil law is dependent in the end upon the capacity of the fighting men and the material wealth of the nation. The incident in Mexico is merely an incident so far as this country is concerned. What complications it may lead to no one knows but the situation is such that it looks like there will be little or no notice taken of it by the outside world.

It is a strang thing to contemplate the war footing maintained by the great powers of the world. Half of the wealth produced by the great nations is spent in maintaining preparedness for war. And one nation will not disarm because the other might take advantage of it when it was unprepared.

Mesico and the people in control in the Southern regulithe can only be brought to a sense of responsibility by armed intervention. It is time wasted to moralize with them. And the only question is whether or not there will be any one strong enough to maintain a stable government even after things are in a degree pacifier.

Those citizens of Mexico who desire peace and security should welcome the coming of the military of the United States. For they can expect no security of life and property under present conditions. And whether or not such a protectorate is established as was established in Cuba, in any event the coming of some constructive people that will assume control and hold in subjection the handits that infest the country will be a hundred times better than present condition.

General iluerta is reported as stating that Mexico vill have 400,000 men in the field in twenty days to repel the hated Yankee invader. This statement is perhaps on a par with his previous acts. Judged by the Mexican standard of morals it is impossible for them to believe that President Wilson's action is inspired by any thing but schilch motives. So it reems like the thing that was sought to be averted has happened at last and that armed intervention on the part of the United States is all that can be expected to effect any hope of peace and protection of lives and property in that country

What can be expected of Huerta, who assumed power by the assussination of his chief who represented the only legitimate head of the republic. What can be expected at Villa a though thirsty bandilt whose record is red with

numberless murders? And under such leaders as these are the people to rally to repel the hated Yankee, whose chief offense is an effort to compel them to be decent and respect the lives and property of the citizens of this nation.

Judged by their own standard of norals it is impossible for these men to understand the action taken by President Wilson, Criminals that they are they consider couriesy to be weakness and honor a thing to let aken advantage of when the opportunity offers. The only way to deal with them is with the nalled fist, and the sooner they are landed on, the better for all concerned.

The Sacramento Bee quotes the Highway Commissioner of Colorado as being in favor of convict labor on highways and reports that his state has secured good results from such labor. Credits are given to the convicts employed in that they have their terms reduced by meretorious work on the state's highways.

This is a sensible way to employ the criminal class. For the country can never have too many good roads and no matter what amount may be expended for this purpose there is always room for improvement. No class of laborers could have legitimate objection for thus employing convicts.

Good roads like cheap transportation benefits everyhody. They increase the farmer's output and his profits. As a result the general wealth of the country is increased and improvements go on space. They make possible the development of mines and open timber lands and any increase in the number of good roads or their improvement naterially helps the whole commonwealth.

And further than that there is a good effect on the criminal classes themselves. There is some incentive for good work, and they are employed in the open air on constructive labor, in the whole the pian seems to have worked well where it has been tried and could be well followed.

General Wila is reported to have refused to Bight against the United States, May this not be because he still wants to import arms and ammunation from this country since they are stopped from other sources by the United States fleet?

The old adage of the Ancients was a "Beware of the Greeks when they bring gifts." In present language it would be "Beware of the Mexicans at all times." For the only cohesion that the army of Mexicans have I shoot their only desire to fight and plunder, one thing seems to be reasonably critain and that is that events from own on will move reasonably fast and that the next year or two will witness some kind of restoration of order.

The World Importance Of Nitrogen.

The I ses of Nitrogen-Why the Earth's Supply Must Continue and Increase -The Mitrogen Problem-The Fixation of Mitrogen,

By Herbert R. Moody, PH.D.

Associate Professor of Applyto al and College of the Applied City of New York

How many of the readers of this publication have ever stopped to think what the source of all vegetable growth really is" lines the reader know that vegetation builds into its structure - metabolizes - elements, belonging to the mineral or morganic kingdom"

In addition to the oxygen, hydrogen and carbon which plants build up into their structure and from which they obtain from water and the earbon dioxide of the air, they need in varying proportions phosphorus, potassium, sulphur, silicon, calcium etc. and they also need nitrogen.

The earth contains certain amounts of these necessary elements and so for a period of years plants may be continuously raised in a given area, but with a steadily incleasing exhaustion of the soil and the crops would be less and less bountiful. To be suce some natural replacement would occur as certain rocks or minerals, were they present, would disintegrate and furnish some of the elements-phosphorus, potassium, calcium, sulphur, etc. It Is also true that parts of the last crop would be left on the ground, potato vines, beet tops corn stalks pumpkin etc., and their constituents would be returned to the soil, but these would not wholly make up for the exhaustion of the land.

For generations it has been known that the farm most be manued or fertilized in some manner. Bone meal, bone ash, or hones had been put on to supply the phosphorus, time to supply the calcium and wood askes to furnish notassium. To the soil has been added stable and ben manute, the contents of the outhouse and garbage beap, etc. In such ways much of the material that the plants had extracted from the earth had been returned. Still there was exhaustion. In the last generation the discrepancy between what was taken out and what was returned has increased. Why? Because what might be called "The Cycle Lafe" of the farm has been destroyed. No longer is all the has that is raised on a farm eater by the cattle there. No longer are all the vegetables that are raised on the form eaten on the place or even in its locality. No longer, then, is a large percentage of the corresponding garbage and excreta returned to the soil of any particular form. Today population is crowded into cities, whence all garbage must be carried away immediately and all excrete must be water carried to the sea.

Tremendous loss is due to the sewage item alone Sir William Crookes estimates that the waster fertilizing material lost to England alone through water carried sewage amounts to the almost includible sum of \$80,000,000. Such waste as this together with Increased needs of man, has made necessary a new undustry-the fixation of nitrogen.

in early days, with a viigin soil had a chance to return much of the plantabsorbed material to the ground, the exhaustion was not noticed, but today the need of artificial tertilizers is seriously increasing. The following figures show the vital necessity of bringing material from afar that the land may be kept fertile. French crops use annually (1906) 600,000 tons of nitrogen. If all stable manure were returned to the soil, there would be but 327,000 tons of nitrogen returned (and all does not go back). In addition to the foregoing, note that France used 236,000 tons of Chili nitre, which is equal to 31,200 tons of nitrogen. Now the deficiency of 273,000 tons 1600,000 less 327,000) is thus only 11 plus per cent made up by nitre. Hence there is impoverishment even with a supply of nitre to draw upon. It was estimated that thirty years from that date the average acreage yield of 127 bushels of wheat winld have to be increased to 20 bushels. To make this increase per acre of 7.3 bushels would require the addition of one and a half hundred weight of nitre, per acte, per year The acreage for wheat at that time was 163,000,000. On these were raised 2,070,000,000 bushels. To raise this to the required 3,260,000,000 bushels would require 12,000,000 tons of nitre

The three principal ingredients of artificial fertilizers are phosphorus, potassium and nitrogen It has always been easy to obtain a sufficient supply of both phosphorus and potassium and their production forms the basis of two great industries.

The phosphorus is supplied by bones from which there is a never failing partial supply of phosphorus, and also by phosphate rock, which in many parts of the world occurs in apparently inexhaustible quantities. Both bones and phosphate rock are largely composed of phosphate of calcium and a simple treatment renders it soluble in plant juices-a necessary step if they are to be used to the best advantage as fertilizers.

The notassium is obtained from salts of potassium which occur in large deposits in Germany. A little of it is also being extracted on our Pacific slope, where in a California desert it is reported to have been found in commercial quantities. On the west roast it is extracted from kelp, which is dredged up from the ocean bed.

Nitrogen, the third ingredient, offers a more perplexing problem. It is chemically lazy; chemists call it "inert." Its principal use in the atmosphere is to dilute the oxygen. In pure oxygen, fire once kindled would be unlikely to go out until all was consumed. Even iron burns in oxygen. A small animal breathing pure oxygen weats out his life in a short time.

It is this property of inertness which keeps nitrogen from easily becoming a part of the plant structure. Before it can be used the element must be chemically combined, unless the plant be of one specific variety. This plant

family can absorb free nitrogen and the growth and decay of its members has been one way in which combined nitrogen has been stored up in the The other contributing cause has been lightning, which is able to cause the nitrogen and oxygen of the air to combine chemically. By these two means a store of what is called "available nitrogen" has been formed in the earth. All varieties of plants could draw from this store and animals ate the vegetation and so incorporated nitrogen into their structure. Now this nitrogen combined in vegetable structure, together with such salts as nitrates and salts of ammonia, is "available nitrogen" since all these forms can be the starting point of the so-called "nitrogen cycle." This cycle consists in the change of animal or vegetable nitrogenous matter into ammonia, the ammonia into nitrous acid and this later into nitric acid. As a salt of nitric acid-a nitrate, the nitrogen may be absorbed by plants. Then the nitrogen in the plant may go through the foregoing changes and the cycle repeated.

Either vegetable or animal matter if piled up and kept moist and somewhat warm, through lack of radiation, will terment, as it is ordinarily called. ammonia in a stable, that is the first step in the cycle Doubtless many have noticed a white efflorescence on stable manure or on the stable wall against which the manure has been piled. That is "nitre"-a nitrate of notassium or calcium or sodium, and it is the result of the combination of the third product of the cycle with whatever base happens to be at hand. Thus is the finish of the cycle-nitrogenous matter in the manure, ammonia forms from it, nitrous acid from the ammonia and nitric acid (in the nitrate) from the second product Planis can absorb this final product and then the nitrogen can go through again all the stages mentioned

So if we kept all that was raised on a farm upon that farm, returned all waste, buried our family and the animals in the fields-theoretically at least, no nitrogen bearing matter need be added to the soil. It has already been seen that old fashioned farm life could not wholly accomplish this and modern life cannot do it as well, so we must replealsh or starve in the future.

A temarkable example of complete destruction of fertility is show in Asia Minor and the Holy Land. Innumerable wars and persecutions have prevented systematic fertilization, all plant food has been taken out and little or none returned to the land. As a result much of that section has been redured to the condition of a desert. Professor Andrew D. White estimates that in the world "a total area equal to that of a first-class European country has been impoverished to such an extent that it is doubtful if anything but a geological change can ever restore it to agricultural use."

We have now seen that enormous quantities of nitrogen combined in organic material, or as ammonia salts or as salts of nitric acid are needed to keep the fields as productive as they were originally. And still greater quantities are needed to raise the increased crops necessary for the increased population. Besides this the world is using enormously increasing quantities of nitric acid compounds for explosives both or war-like preparations and for peaceful arts, such as mining, quarrying, and excavating. In addition our dye industry has been entirely changed since the last genera-Formerly we relied on animal and vegetable colors; now we produce them from aniline. A whole class of these new dyes are called "azo" dyes from the fact that they contain nitrogen in their structure.

By this time it must be evident why we speak of the nitrogen problem.

Where are we to find the sources of nitrogen which are needed for all of the foregoing purposes?

There are \$1,000,000,000,000 tons of nitrogen in air over the United States and naturally a proportionally greater weight over the rest of the world. But nitrogen, as has been sald, must be induced to join with some other element or elements before it is useful. With this one exception: Padbearing plants were long known to flourish where other crops failed. Recall the beach-pea and think how little nourishment it can get from the sand in which it grows. For some time this was not understood. But recently improved bacteriological methods showed that on the roots of such plans colonies of bacteria lived and "fed" the atmospheric nitrogen to the plant. Thus the presence of much "available" nitrogen in virgin soil is accounted for-stored up in past ages through the life and decay of such plants. The government (and business houses also) now provide cultures of these nitrogen fixing bacteria and soils in which they are not naturally present may be impregnated with them.

For all other plants, nitrogen must be provided either in a form which will change to nitrates, or in the nitrates themselves. Before we begin to see themselves. Before we begin to see what sources there have been before the recently devised processes of "fixing the nitrogen of the air" were invented. Nitrogen, as has been already said,

is returned to the soil, to some extent. in stable manure and household refuse. In addition we have guano (bird excrement from rainless islands off South America), animal refuse, scrap skin. hair, butchers' scrap, blood, tankage, fish scrap, etc. These are used in large quantities. This country produced 18,-000 tons of dried blood in 1910, costing \$567,000, and used even more. It used 47,000 tons of guano, costing \$822,500. Each year there are 703,525,500 pounds of food fish caught in this country Twenty-five per cent of this is waste so there is produced in the United States alone 175,881,375 pounds of fish scrap. This, two, is an excellent source of nitrogen.

Coal, too, is a source of nitrogen; it contains 2%. When coal is distilled to make coal gas most of this nitrogen appears as ammonia or its salts. In this industry, and the allied coke in-

dustry, there have been unbelievable wastes. Formerly little attempt was made to catch the nitrogen compounds although the process is simple. The following figures will give an idea of how much nitrogen was wasted. The figures were compiled by Professor Charles Parsons.

In 1911 aver 406,000,000 tons of bituminous coal were mined in this country. In it was \$160,000,000 worth of recoverable ultrager and yet only \$800,000 worth was recovered. Pennock \$800,000 worth was recovered. Pennock states that from 1893 to 1919 econocy states that from 1893 to 1919 econocy the nitrogen in it to have viewlengen in it to have viewlengen in the one of the worth \$55,000,000.

Added to these sources of nitrogen has been "sultpeter" formerly made almost entirely in tropical, more or less rathless countries. There potasium nitrate was cultivated by spontaneous or "assisted" action of bacteria upon nitrogenous organic matter Potassium nitrate was the product of this action.

The greatest source of all is the famous Chili nitrate field. Here a geological upheaval out off an arm of the sea. It is a rainless country. The water evaporated and left a mass of organic matter, salts of sodium and other metals. The nitrogenous orgame matter went through the "cycle," with which we are familiar, and sodiam nitrate was the result. This material is found in a desert 430 miles long and of variable width. The deposits vary in depth from a few inche-A simple process of soluto 16 feet tion, filtration and crystallization us Chili niter, more recently indispensable. The new processes make it possible for us to view now with some complacency the dominishing supply from Chili.

This substance was first excavated in 1825. A ship band of it could not be sold in England and had to be thrown away. In 1820, 1,000 tons to be thrown away. In 1820, 1,000 tons in 191, 2,000,000. The world paid \$100,000,000 for Chill nitrate in 1911, and this contry paid \$2,000,000,000 for its share. It expected that in 1915 the world will consume 1,000,000 tons, which will expected that in 1915 the world will expect exist that the substantial expectation of the substantial expectation.

Authorities differ as to the length of time this wonderful source of nitrogen will last. A Chillian commission in 1907 placed at at centuries from that time. The Nitrate Propanga Association place it at 30 years. Others set the date of exhaustion at 1940.

The foregoing will have shown how much available nitrogen is needed and how inadequate the supply soon will be. Is it any wonder that chemists have been working on, and are still busy solving this great problem of making available the inexhaustible, but inert, nitrogen which is all about

Power was the crucial factor, and in the next issue we shall show how by some of the greatest engineering feats of modern times power has been transformed into a proper form of energy to act upon the nitrogen and make it inert as it is, combine and so become available.

This is chemical fairy land. These industries are transforming quiet

one valleys into bustling, humoutstrial centers. They are rea few isolated farmers' buts dern beautiful cement dwelffigs Lalong orderly streets. They are more, they are saving our detents from actual streation which is surely come if no means had bound to return nilrogen to the

The Nitrogen Problem is being dved:

Fig. it years have clapsed since the sten conflagration of 1906. Perhans the areatest fire in the worlds' history it are been followed by the greatest rebuilding period. And that under labor conditions that obtained nowhere else in the world. The great monuments of belony, the pyramids and temples, the sight wall of China and the Taj Mahal have been the products of slave labor. Beland the splendid architecture is blend of thousands of human beings, But in the structures of San Francisco is the labor of mechanics, who have recentral the wage for their skill. So that in the rebuilding of the city the million part of the money has gone to the homes of the laborers, the skilled urtisans and the mechanics. The past eight years has witnessed the expenditure of hundreds of millions of dollars in the rebuilding of our city. While it is not altogether what it might be. still it is a city of which we may well be proud.

EXPOSITION NOTES,

Henry Bacon, one of the leading archites to f New York, is now on his way to San Francisco to superintend the finishing of the great Court of the Four Seasons, which will he the first of the five counts to be completed.

Plans for the payllions of Massachusetts and the Philippines were approved March 31 and the actual work will begin in a few days Datho's building is almost completed and New York probably will have the distinction of having the second state payllion to be finished. Honduras has completed her payllion, which is on a site commanding the foreign and state areas.

Paint From Benns.

Prom Manchuria comes the Invention of a new paint that is both waterproof and Irreproof in addition to being cheap and durable. "Solite" is the name of this new product, and three months after its Introduction it found a ready market in Shanghal, Harbin and Tientsin. It is reported that the Japanese navy is testing it with a view to adoption. "Solite" is made from bean oil which is produced in tremendous quintifier in Manchuris.

An L800 Years Old Egg.

An egg which cannot be said to be less is one which dates from 1.800 cms back. It was found during recent evaluations made at Nikopolis, in the lend of an 11 months old child. Sextus its 180 ss. Already more than 80 tombs are been explored by the archaeologic service in this ancient city, which we built to commence the battle of vettim. Among the finds are a quantity of gold jewels, also potterwing lamps ornamented with elegant increase in relief.—Scientific American.

Firms desiring news on special classes of buildings, such as Books, Charckes, Schools, Hotels, etc., will find such from all classified and graphe ander proper hendings, commencing on this page. These same Items are again repeated under "LOCALATIES" in the last part of our sewa department.

APARTMENT HOUSES.

SAN FRANCISCO Apor ment house, story and base from Cost not ated Architect W. J. Welsh, 22nd and Mission Streets S F Owner, L. Cella. The building all 'e erected at the corner of Post assiste and Hugo street and has been designed to contain four suites of four rooms each with bath. Interior fines will be of pine with some elm pinels and hardwood floors. There will be an automatic water heater in each apartment Bath rooms will have tile wainscot and composition floors. Wall beds are specified Exterior of the building will be covered with cement plaster on metal lath. Plans are complete and the work will be done by Day Labor.

SAN FRANCISCO Apparament house alterations 2 story traine, \$10,000, Architect Clay N. Burrell, Albany Bldg, Oakland Owner J H Dieckmann. The present building located at the cotner of California and Laguna streets will be altered from a flat building into a modern apartment house When complete there will be eight apartments of two and three rooms. The work will call for new interior partitions interior baish, hardwood floors plastering plumbing, electric work and painting Exterior of the building will also be refinished.

BERKELEY ALAMEDA CO, CAL-Apartment house, 3 story and base, brick and frame \$18,000 Architect, Clay N. Burrell, Albany Bldg , Oakland Owner, C. F. Renz. The building will be erected on Alcatraz avenue and has been designed to contain stores on the first floor and a number of modern apartments on he second and third floors. Internet finish will be of pine and redwood with some the panels There will be steam hoat and a hot water supply. All suites will have wall beds and private but 1 100ms. bath rooms will have composition floors and tile wainsent. Exterior of the building will be covered with cement plaster on metal lath. Plans are now being prepared

RICHMOND, CONTRA COSTA CO CAL-Apartment house, 2 story and base, brick \$17,000 Architect, M. J. We'sh, 22nd and Mission Streets, S. F. Owner's name withheld. The building will be elected on Macdonald avenue near 10th street and has been designed to contain stores on the first floor besides the entrance to the apartments, Upper floors will contain about 30 rooms atranged in three and four room suites with boths. Interior will be finished in pure throughout. There will be steam heat and a hot water supply. All suites will have wall heds and private bath rooms. Bath rooms will be finished in tile. Exterior of the building will be tased with pressed brick Plans are complete and figures are being taken.

SEATTLE, WASH Apartment house, 5 story and base brick, \$100,-800. Architect John Graham, Lyon Bldg., Seattle Owner 10 R. McKay. The building will be elected at the taken.

soutreast of old only 120 fort | 120 fort of common designed to contact | 120 fort of common designed through the contact | 120 fort of common designed to contact | 120 fort of common designed to commo apartments will loods Interior finish will in wood. Marshall Stearns Co vs David Miller\$1110 BRADSTREET ESTABLISHES OAK-LAND OFFICE.

360 E Wehster E 51xS 162, Okd.

On May first Bradstreet will open an office in Oakland, California, with Mr. J. K. Munsell in charge as Superintendent

The establishment of this office by Bradstreet as one of the 150 stations in the principal wholesale and jobbing centers of the United States is at one and the same time, a recognition of the growth and importance of Oakland and the east bay shore community commercially, and the provision for additional business facilities to the citizens of that district.

Mr. Munsell is a native of Oakland and a graduate of the University of California with many years experience in Bradstreet's office work six years of which was spent as chief clerk of the San Francisco office.

The Oakland Bradstreet like all the offices of that concern is an independent one except in its relations to the headquarters, in the East.

MARIN, CONTRA COSTA AND SONOMA COUNTIES.

SCHOOL-2 story and base. Class C construction, \$45,000. Rio Vista, Solano Co., Cal. Architect, Erwin Schaefer. Plaza Bidg., Oakland, Owners, Rio Vista High School District. Contracts Awarded.
GARAGE—2 story and base, brick and steel, \$28,000. Seattle, Wash, Architect, none. Owners, Firestone Tire and Rubber Co., Seattle. Contractor, L. L. Lang, New York Eldg., Seattle. Contract price, \$28,000.

---The laying of the foundation stone of the San Francisco Auditorium marks the formal ceremony of a pubpletion. And the first building of the lie bullding well on its way to comnew (Tvic Center is to be the assembly hall for the public meetings and conventions to be held here. It will be a most valuable asset to the city. And in t'e accommodations it will furnish for all kinds of gatherings it will place San Francisco in the front rank as a convention city.

It is said that the big exposition organ will be installed in the auditorium after the fair and this will be an added attraction. An auditorium is something we have needed for a long time and its final completion will be halled with delight.

BOTH THE OWNER and the Architect are particularly interested in all kinds of building materials, power and heating systems, building specialties, every accessory that goes into their project. Every issue of the Building and Industrial News contains hundreds of new building and construction reports giving the names and addresses of both the owner and the architects. Both the owner and architect receives a copy of the Building and Industrial News containing mention of their individual job conspicuously marked. Thus the builder and the architect have in their hands not only the news items of their particular project, but also the announcements and the advertisements of energetic business men who have goods to sell that are necessary to construct and equip the undertaking. IS YOUR ADVERTISEMENT AMONG THESE?

Catarrh Can Be Relieved

HERE IS NO NEED for you to continually suffer from Cat arrh and Cold in the Head. It makes you miserable, doesn't it? You really don't care whether things go right or not and you wonder when you'll ever get over it. And you will not get over it until you get the Clover Leaf Catarrh Remedy, and use it. It will relieve you, and you'll wonder why you had not used it sooner. We are so positive that this will relieve you of your Catarch or Cold in the Head, that we guarantee you satisfaction or we will refund your money.

Editorial Comment.

Relative to our Industrial Academ Commission and the Safety Applian Commission of the Safety of the Safety Appliance of the Safety of the Safety Commission Commis

The total number of non-fatal acidents in the State was \$5.93, or about one for every ten wage-workers. The board is of the opinion that at least half of these can be prevented through improved inspection methods, by safe-guarding machines before they leave the factory, by the maintenance of safety museums, through lectures, moving pictures, school talks and the elimination of danger spots in plants, there were 471 fatal accidents, classified as follows:

Assault and fighting..... Railroad equipment 119 Falls Vehicles Hand labor Elevators 33 Electricity Street Railways Boiler explosions and burns... Excavating Miscellaneous Asphyxiation, drowning, etc... Animais, insects, etc..... Shafting, set screws, etc Falling material Machinery peculiar to special industries Belting Infection from trivial cuts. burns, etc. Sowe Explosions (not hoiler) Hoists Presses Gears Emery wheels

Occupational diseases

Wood molders

THE OPPRESSED BALD HEADS.

What is there about haldheadedness to arouse laughter? That profound inquiry is suggested once more by a gen-

theman with a grievance who writes to Public Mind. Comedians, he says "alleged" comedians he prefers to call them—always make the latificaded men the butt of their jokes. He doesn't we why he should be ridicalled for the boss of a limb.

Quite right. He shouldn't be, but he There is no logical reason for lauging when the dignified gentleman slips on a piece of banana peel. But you lough, all the same. Considered in the light of pure reason there is no occasum in the world to even smile when you see a man chase his hat up the But you do. The sense of humor doesn't work by rules of logic. So the man who is involuntarily baldheaded is considered just as fair game lot the jokers as the human angoras who are responsible for letting their hair grow long. He oughtn't to be so no doubt But facts are facts.

People have been making sport of the bathleads from the time of Elisna. There seems to be nothing for the bathleads decreased to make the best of it unless he has a couple of she hears handy to sek on his defaurers, as Elisha did in the case of the children who mocked him as he was going to Beth-el. That is the only time on record when a baldhead ever sol even.

Work is progressing rapidly on the new municipal car lines. It looks like there will be some accommodation given the district of the fair grounds to the close of the year in spite of the arthon or non-action of the United Rail Roads. As the transportation problem is a serious one the rush work with he appreciated by all, not only on account of the fair, but because of the accommodation it will afford

It is estimated that the present population of the United States and its dependencies amount to 109,000,000 people. That is certainly a great number and emphasizes the fact that modern civilization has increased longevity. For the standard of living has been added and the great majority of tuese unillinos are independent citizens unkeen the transactulated hordes that people the valley of the Yang-tse-klang and the Ganges.

The harbaric nations of the past have sometimes included great numbers. The human race was fecund and the birth rate per capita was much higher. Ent wars and plarues decinated the nillhons and what was gained in years of prosperity was lost in the night which followed. Modern science and civilized conditions is rendering the tot of the average man better and distributing the products in a more equitable manner.

The Building Of San Francisco

Reprinted from the Campanile

The reward of flow with the flow with the meeting of the meeting o

"A fittle after cleven, says Father Four in the entry in list diary for March 27, 1776, "we halted beside a pond or spring of line water near the month of the port of San Francisco, having traveled some say league

eThe port of Sin Flanceso is a worder of nature, and may be called the port of ports on account of its great capacity and the various highest included in its librad or some and in its islands. Choosed in and surrounded by monitables, it is a question in a cup.

"The commander de ided to erect the holy cross on the extremoty of the white cliff at the inner point of the entrance to the port. At right o'clock in the morning we ascended a small low hill, and then entered a table land, entirely clear, of considerable extent. and flat, with a slight slope towards the port, it must be about half a league in wolth and a little more length, and keeps narrowing until it ends in the white chiff. This table land commands a most won lerful view, as from it a great part of the port is visible, with its islands the entrance, and the ocean as far as to eye can reach-even faither tean the Faral-

"The commander marked this table land as the site of the new settlement, and the fort which is to be established at this port at this port in the long of a this port at this port in the long on a height it is so commanding that the entrance of the port can be defected in misket fire and at a distance of a misket shot there is water for the people, that is, the spring or nound where We halfel?"

All that day the commander and his lieutenant pagmed over "the low hills leading toward the inner part of the port," and at evening they returned, "very much pleased, as they had found more than they had hoped for-much brusa and firewood, plenty of water in various springs or ponds, much tillable ground and also plenty of pasture everywhere, so that the new settlement can obtain much wood, water, grass or pasturage for their horses, all close at hand-there is lacking only timber for large editices, although for huts and barracks, and for the stockade of the preside there is sufficient material in the woods

The Indians they encountered were "gentle, good-natured, and very poor, and as they presented to maselves unarmed they gave no sum of being war-like or ill-intentioned. Those who live near the port are pretty well bearded."

Thus San Francisco was bearing its rude pioneer beginning, in the subrude pioneer beginning, in the signiing of the bectaration of Independence But in Sonora, where bon Juan Bantosta de Anza organized his expedition, there had been missions for a century and a half disead, and towns that antedated by many years the first settlements in Massachusetts Bay.

The first day's pourney of the Ansa Expedition was a seamt three miles, out from the Presidio of San Miguel de Horcasitas, in Sonora, Mexico. Most of the day had been taken up with singing a mass to the Most Blossod Virgin of Guadalupe and getting the packtrain ready. That September day of 1775 was the starting of a three-months' march over a stretch of wild country as vast as from San Francisco to Denver or El Paso, or from Washington to New Others.

The last Christian settlement passed near the Mission of San Xavier del Bac, in Southern Arizona. But the Indian "nations" through which they passed were kindly and hospitableonce the country of the fierce Apaches was left behind. The "governors and alcaldes" of the Papago villages came hearing Apache scalps and asking baptism. Elated at the arrival of the arrival of the Spaniards, they comed the white men and proudly exhibited the "Casa Grande de Montezuma." "This palace," says Father Font, "may have been built some 500 years ago. It seems that this place 111.0 0 founded by the Mexicans when, during their migration, the devil led them through various countries until they arrived at the promised land of Mex-

Timbers brought from the mountains seventy-five miles distant, a very large-conduit to carry water from the rivel, and round apertures in the walls through which "the prince" had "saluted the rising and setting sun"—these were part of Font's observations.

At Yuma the Spaniards left two priests to minister to the 3,000 Indians. and then, after much traffiking of heads and tobacco for watermelons. pumpkins, and other provisions, the expedition started across what is now Imperial County. Once, their cartle stampeded to return to the last water holes, again they were snowed on, and on Christmas day they stopped their march for one day, "for the reason that on this holy night of the Nativity the wife of a soldier happily gave birth to a son and because the day was raw and foggy." A day later, when they had halted near the rocks of San Carlos Pass, almost at the summit of the Sierra Madre, they were shaken by an earthquake, "accompanied by an instantaneous and loud noise."

Soon they reached the Mission of San Gabriel, 'in a most beautiful and ample place, with plenty of water and very good soil.' News had come of a rising of the mission Indians at San Diego. They had burned and plandered, and murdered the muister Father Luis Jaume. Commander Anza, Chaplain Font, and twenty soldiers set off posthaste to bring aid. The blabbring of an old woman gave evidence as to the guilty. Thirteen prisoners were taken, and the recalcitrants fled to the mountains.

Six soldiers were despatched on the seturn fourney to Sonora, bearing letters. Scarcely had Anza and Font returned to San Gabriel when a soldier from Monterey deserted, and accompanied by four servants and muletters, with thirty animals and much loot, fled away across the mountains into the desert, only to be brought back priserer.

From San Gabriel the 200 members of the Setor Commandante's expection proceeded northward up the coast, across the Santa Clara valley, by the village of Carrinteria, past the Mission of San Lalis Gaisso, "in a beautiful sied on a little rise beside a stream, near the Sterra de Sante Lucia, with very fertile lands. The Indians of this mation are much better looking and seemly than those of any other nation. I have seen:

At Monterey they were welcomed by Junipero Serra, Father President of the missions, and at Carmel mission the seven resident Padres sang a Te Deum, with peals of bells and great rejoicing. "The site is splendid, and the land very fertile," says Father Font,

March 23 they set out once more from Monterey, traveling by the Valle de Santa Delfina, the Monterey River, the Arroyo de las Llagas, the Arroyo de San Benito, the Pajaro River, the Valle de San Benardino, the Arroyo de San Joseph Curpetino, the Arroyo de San Mateo, the Arroyo de San Francisco, and on the fifth day, March 27, 1776, halted by the Golden Gate.

After spending only a single day at the new town-site, Commander Anza and his immediate party left the settlers to begin the creation of future city of San Francisco, and set out to explore the neighboring region. They killed "a huge bear" in the Arabout the lower end of the bay, and followed its shore past villages whose Indians were fishing for salmon with nets, off tule rafts. The deer tracks were as numerous as if an immense herd of cattle were about. At last they could look out across "an immense treeless plain," to "a great snow-covered mountain range." They concluded that the river was not a river, but a great 'fresh-water gulf,' and imagined it to extend as far south as San Luis Obispo. Desnairing of getting across the fule-swamps, they turned southwest through the coastrange and made their way back to Monterey, and on to San Gabriel, and across the desert to the Colorado River Father Garces whom they had left five months before, was not to be found. His companion, Father Tomas, had had no news of him 'since he went up the river to the Jalchedunes," with the thought of penetrating into the interior and discovering a way of getting into New Mexico.

'I infer," says Father Font, "either that Father Garces has found a way and means for getting to New Mexico as he desired, or that he has had some great reverse in his apostolic visitations; indeed, as he was ailing, he may have died, or the indians may have killed him."

But Font himself suffered no such reverse. Eleven of the party crossed the hundred-yard wide Columbia River, turbulent and swallen trans melting snows, on a single raft it began to sink, but forty Indians plunged in, and surrounding the raft, took the party across with no harm but a wetting. They bade farewell to the Viimas "with much tenderness on a count of their fidelity and affection and passing unharmed through todangerous country of the unfriendly Aprahes and the "even worse" Seris and Pimas, came safely back to Sanora, two months after starting from San Francisco. And there in Mexico at the Mission of Ures, Father Fant "wrote out this diary," the original of which the University of California possesses. through the gift of the Robert E. Cowan collection by Collis P. Bunting-The diary has now been edited by Frederick J. Teggart, Assurate Professor of Pacific Coast History in the University of California and Curator of the Academy of Pacific Coast History. Its publication, in English and in Spanish, is a part of the great work that is being done at the University of California, through the famous Bancroft Library and the Academy of Pavific Coast History, of giving to the world authentic memorials at the exploration, the settlement, and the development of California.

Interior will contain, besides the class rooms, a large assembly hall, chapel and gymnasium. There will be steam heat, oil burning furnace, program clocks and hose reels. Interior will be finished in pine with maple flooring. Blackboards and other common school equipment will be used. Exterior of the building will be faced with pressed brick. Plans are complete and buds are now being taken.

STORES-2 story brick addition. Architect, A \$10,000. San Francisco. W. Pattiani, Merchants' National Bank Bldg, S. F. Owner, A. S. Macdonald Mills Bldg., S. F. The present one-The present onestory brick building on the north side of Market street east of Page will be added to by the construction of two The entire lower floor will be stories. occupied by a coffee house and upper two floors will be arranged for a number of rooms. Interior finish will be of pine. There will be a but water supply. Two baths to the floor will be installed. Exterior of the building will be faced with pressed brick. Plans are complete and figures are being

FLATS-2, 3 story and base, frame, \$1,000 and \$6,000. San Francisco. Arsuitect, Paul F. De Martini, 2123 Powell street, S. F. Owner's name withheld. These two buildings will be erected on Greenwich street near Powell, and cach has been designed to contain three flats. Interiors will be finished in nine, redwood and hardwood veneer. tak floors will be used in the living cooms. There will be open fire places and tile mantels. Bath rooms and kitchens will have tile wainscot. Automatic water heaters will be installed. Entrances will be finished in tile with terrazzo steps Exteriors will be covered with shiplap and cement plaster on metal lath. Plans are complete and ngures are now being taken for the work.

HOTEL-3 story and base, brick and steel, \$20,000. San Francisco. Architect. W. J. Cuthbertson, 328 Montgomery street, S. F. Owner, Ellen E. Herrin. The building will be erected on the north side of O'Farrell street west of Larkin, covering an area of approxmately 12,000 square feet. There will be fifty guest rooms, nearly all of which will have private baths. Intefor finish will be of pine and redwood. Plans provide for steam heat and a hot water supply. Bath rooms will have tile wainscot and composition floors. Entrance will be finished in marble and tile. Exterior of the building will te faced with pressed brick. Plans are complete and figures are being taken.

HOTEL-6 story and base, brick and steel, \$25,000. San Francisco. Architect, Chester H. Miller, Dalziel Bldg., Oakland. Owner's name withheld. The building will be erected on Post street near Larkin and will have a frontage of 29 feet and a depth of 78 feet. There will be a store besides the hotel lobby on the first floor. Upper floors will ontain in the neighborhood of 75 rooms, all of which will have private baths. Interior finish will be of pine and elm. Plans provide for steam heat, elevator service and a hot water supply. Bath rooms will have tile wainor and composition floors. Exterior of the building will be faced with pressed brick. A complete steel frame will be used. Plans are complete and ngures are being taken.

CIVIC CENTER IMPROVEMENTS-Cost not stated. San Francisco. Architects, City Architectural Department, Temporary City Hall, S. F. Owners, City and County of San Franusco. The Board of Works has forwarded to the Supervisors a report from the consulting architects in regard to improving the two blocks in the Civic Center, which have been set uside for a plaza, with a request for \$64,000 for carrying out the plan of the architects for the adornment of this square. The plan is to level the (wo blocks and create a park. A large part of the estimated expense is for proposed temporary sculpture work and modeling of balustrades, pedestals, fountains, electrollers and other decorative features. The temporary figures and models will be used later as tle tasis of the permanent work of this character, the purpose now merely being to make the Civic Center attractive for exposition year. The Finance Committee of the Supervisors is disinclined to expend any large amount at present for temporary purposes, and may limit the outlay to parking and gardening.

1911

City Bids Opened.

Pive Sets of Figures Submitted With Seven Proposition for Marble Work on New City Hall.

The Bonn of Pulsa Works received five sers of late at their Wednesday afternoon meeting for the markle work at the City Hall. Buds were submitted with seven alternative propositions ealling for different combinations of morble and for different amount of work. All bids were taken under consideration.

Exterior of the building will be faced with pressed brick. Bids are now being taken and will be opened in Washington, D. C., on May 20th.

A COMBINATION FILTER AND FAUCET.

The cut above illustrates cleaning filter and fauret combined, recently perfected by Mr F. L. Guil-lemet of this city. The faucet part proper is the same as in the regular compression bibbs on the market and will be understood at a glance the water valve (c) being opened and closed in the usual manner by turning the handle, but a filter chamber is formed above the spout (B) and a filter (O) fitted therein, and the water has to pass through this filter reaching the spout. The filter is evin drical in shape and open at both ends, but the top end is closed by a cap (d), which is provided with a disk htting snugly inside the end of the filter Said cap is made of one piece with to plug (X) and connected with it by a short stem, so that when the plug (N) is removed, the filter will come out with it, but can be detached. Plug (N) is provided with four lugs (h) atranged in a square, for insertion of any small rod or a spike for tightening the plug when no monkey wrench is at hand, but hand power alone may he sufficient in most cases

The lower end of the filter fits much around a collar (h), the lower part of the filter being broken away to show this collar. Now it will be seen that the water has to pass from the outside to the inside of the filter for reaching the spout (B), which increases very materially its resisting strength against water pressure and the water does not tend to open the pores of the filter in passing through it. The bottom of the filter is con-

nected with a small passage or tubing (K) designed to carry away the impurities in the water in proportion as they are stopped by the filter. This passage remains always open and therefore whenever water is drawn out a streamlet flows through this passage at the same time it flows through the spout The tube passes through a perforated lug which acts as a bracket below the nut (S). and the end of the tube is bent downward more or less, so as to direct the streamlet of impure water to drop on the slanting side of the sink.

The tube K is long enough to prevent what is known as the venturitube effect whereby a fluid at any given pressure flows faster through a narrow opening than through a larger one. In parts where water is very scarce and expensive, a long piece of rubber tubing may be attached to the tube K for collecting the waste water to be used for other than drinking or culinary purposes.

The space around the filter is designedly made very narrow to accelerate the speed of the water as it flows down the flank of the filter so as to give the impurities in the water no chance to stick to the filter.

The filter is intended to be made of brass gauze No. 200, which is from 4 to 10 times as fine as any kind of cloth usually attached to faucets for filtering nurnoses.

It will do away with this crude method of filtering; being nuch more efficient, self-cleaning, and changeable when were out. Anyone wishing to investigate further into this should communicate with the inventor, F. L. Guillemet, 2529 Mission street, San Francisco.

Juuction Market, Mason and Turk Streets

OTH THE OWNER and the Architect are particularly interested in all kinds of building materials, power and heating systems, building specialties, every accessory that goes into their project. Every issue of the Building and Industrial News contains hundreds of new building and construction reports giving the names and addresses of both the owner and the architects. Both the owner and architect receives a copy of the Building and Industrial News containing mention of their individual job conspicuously marked. Thus the builder and the architect have in their hands not only the news items of their particular project, but also the announcements and the advertisements of energetic business men who have goods to sell that are necessary to construct and equip the undertaking. IS YOUR ADVERTISEMENT AMONG THESE?

Catarrh Can Be Relieved

HERE IS NO NEED for you to continually suffer from arrh and Cold in the Head. It makes you miserable, doesn't it? You really don't care whether things go right or not and you wonder when you'll ever get over it. And you will not get over it until you get the Clover Leaf Catarrh Remedy, and use it. It will relieve you, and you'll wonder why you had not used it sooner. We are so positive that this will relieve you of your Catarrh or Cold in the Head, that we guarantee you satisfaction or we will refund your money.

Editorial Comment.

Building operations for the month of April fell somewhat belund that of the previous months. Stated in the figures tabulated from the permits issued and contracts filed the record is as follows: Brick and concrete, \$840,176; frame, \$902,555; alterations, \$178,825 making a total of \$1,921,556 for private work; to this is added \$221,131 for city building construction, \$71,656 for street work, \$217,036 for State work and \$8,700 for U. S. Government construction within the city limits; also there is \$280,790 of work on the Panama-Pacific Exposition, making in all a total of \$2,795,350 for the month. This averages up for the year, for commencing with January 1914, the totals are as follows:

January,	1914										\$1,928,50	13
February.	1914										2,331.8	iii
March, 19	914 .										3,507,7	63
April, 191	4										2,795,3	511
Compared	to	1	1	e	١	'n	, 1	u	s		years	th
word is as	follo		es.									

AUTH,	1900		,	٠		٠	٠				\$ = , = = 0 , d d d
April.	1906										3,096,561
April,	1907	,	,								6,556,007
April.	1908										3,306,676
April,	1909										3,330,909
April,	1910										3,383,269
April,	1911			,							2,139,696
April,	1912										3,135,334
	1913										3 327.584
April.	1914							,			2,795,350

Generally speaking the month of April has usually been a pretty good one for the building business. Comparing the figures for the past ten years, the record shows more than an average of 2 millions. It must be remembered that the above figures are for private construction up to 1913. but since that time the total contains all the work of the City, State and U S Government. Altogether the figures show a record about what could be expected under present conditions. Frame buildings predominated over permanent construction so that the inference is that dwelling houses and flats are being built and that the ordinary private construction is about up to normal

There has recently been demolished ten-story tower building at 60 Broadway, New York city. The building was erected in 1889 and has been in service for a quarter of a century. Naturally to make way for a larger structure, at the condition of its framework was a matter of interest for architects and engineers. The frame-ouslisted of cast from columns and wrought from those beams. The fluors were of fitt-architectra coits construction. The framework was found to be in excellent condition, the wrought from becamework is a construction.

showing a practical absence of rust, and the cast Iron columns, with a three-inch cast fron shell around them for fire protection, showing only a few localized patches of rust and heavy rusting only at a few special points.

In these days of steel construction we ordinarily forget the fact that this term of structure has been in use only a quarter of a century. That there has not really been time enough yet to test the enduring qualities and that practically few of these structures have ever been torn down so that it has not been possible to determine the life of steel under the ordinary conditions of building construction.

Un to the second election of Diaz, in 1884, Mexico had fifty-two Dictators, Presidents and rulers in fifty-nine years.

The statement may seem incredible, but it is made on the authority of the British Encyclopedia.

An even Diaz, who crushed many incipent revolutions with a hand of fron, at last was forced to leave the country by the Mexican love of change.

Judging the future by the past then there seems little hope of establishment of any stable government in Mexico by means of mediation. There may come some man strong enough who will have the support of a majority of the people long enough to restore order in the country, but it is doubtful. It seems impossible for a people of their mold to ever work out any sort of salvation for themselves.

A MOVEMENT FOR GOOD ROADS.

The American Highway Association and the American Bar Association have inaugurated a movement to remove from the statute books of various States, ancient and obsolete road laws which have been on those books more than one hundred years. step in the revision of the State road laws would be to recommend that all absolete and unnecessary laws be resounded. Certain basic features good administration will be urged by the joint committees, such as payment of road taxes in cash, elimination of unnecessary officials, the requirement of skilled supervision in construction and maintenance, constant employment of highway engineers, the substitution of appointed for elected officials and the substitution of continuous maintenance for the present intermittent methods.

The unbought loyalty of men is the

The Problem Of The High Cost Of Living

The Fullity of Local Effort.

By John P. Young.

Is Conted from the Proceedings of the

The attempt to discover a remedy for the real of fancied cytls of rising prices by studying local phenomena can produce no good result. On the contrary, it is calculated to do mischief by obscuring the true cause of the ting complained of this tending to deter the application of a really efficacious remedy if there is a real economic discose to be angel.

No fact is better established than the complete interdependence of the neonle of a country in which no internal tax barriers are reared. The United States is such a country, and the commercial relations between its inhabitints are so close that the same price levels are maintained firoughout its length and breadth Any variations from the general level are wholly attributable to added costs incurred through bringing commodities from distant points where produced or manufactured to the places where they are consumer

If there are departures from this that they are due to causes which can not be reached excent through regulations of the sort which deprive people of therty of action. To illustrate: might be teasible to municipal ordinames to establish markets or a huge general market at some central point in the city but in order to insure its success if would be necessary to probibit the convenient but costly green grocery. Actual experience in San Francisco demonstrates that this is the case. Free markets, so called been founded but they have failed of success through lack of patronage. Convenience More Than Cheanness,

Enquestionably the neighborhood store is uneconomic but the number is constantly increasing in this and other cities, despite the fortit at the department stores which buy on a large scale sell much more caeaply. The citizen might be compelled by municipal ordinance to forego conventence for cheapness, but there is grave. reason to doubt wiether there would be an econonne gain. A paper of pans might be sold in a department store for 5 cents, but if the housekeeper who lived two or three miles distant from the large tablishment had to consume two or three how s' time or spend to cents for car face yoen she wished to buy pins sle would not effect a great saving-The small stone can be proved wasteful but its persistence snows that the denionstration is only theoretically sound and that in practice it fills an economic want.

In the last analysis it will be found that the increased one of living represents an increase of units of satisfaction. It has been said that "the cost of high living" is at the bottom of the modern trouble, but the saving, while containing an economic truth, is unfortunate been use the words insent to express the idea convex the impression that the people are revelling in huxury. "High living" in the minds of most men

stands for luxurious living and that condition has not yet been attained by the masses

Higher Standard of Living.

But the evidence is overwhelming that there has been a vast improvement in the mode of life of peoples living in countries where the prices of commodities which have come to be regarded as necessaries are high, while, on the other hand in those hands where the demands of the people are few the things consumed by them are priced China and India furnish notable examples of cheap living, and the variety and quantity of their consumption harmonize with the low range of prices in those countries. The United States presents the other extreme. standard of living in this country is not proved by the fact that the per capita consumption of food products is greater than in other lands; it is estiblisted by the evidence that the prople generally demand a greater variety for the table and insist upon the employment of a vastly larger number of articles of furniture and adornment and of conveniences and amusements.

As the propensity to indulgence of this sort increases it is usually accompanied by a change of local price level. It is not likely that this tendency can be arrested in any locality unless, indeed, the disposition to enact minimum wage laws should increase to such an extent as to arouse a recrudescence to the natural laws which Adam Smith and other economists claimed was in constant operation under the competitive system-that of pressing wages to the limit of subsis-If that result occurs is will come about through an extension of the altruistic idea responsible for the legislation which assumes that any person willing to work should receive a reward sufficiently great to subsist him. The legislator who attempts to designate the amount necessary to properly subsist an individual easily be induced to prescribe by law what constitutes proper subsistence. If regulation has the effect which economists predict, of curtailing production, of necessity the standard of living will be lowered, as there will be less to go

At present it does not appear as if the problem would, ..ork ..ut in the manner suggested. When Adam Smith wrote, and for nearly three-uarters of a century afterward, the competition of labor was unrestricted, but with the advent of modern trades unionism a new factor entered. The operation of the assumed natural law was suspend-By combination the worker was enabled to secure a greater share of the things he helped to produce, and he succeeded measurably in improving his condition, a fact which exhibited itself in a steady elevation of the standard of living in all countries, but more particularly in those possessed of natural resources and in which inventiveness has enlarged the ability

The Standards of Living.

If we convert the phrase "improved standard of living" into what it really represents, namely, an increased acmand for things, we have what seems a simple explanation of the cause of rising prices, or we should have, if it were possible to preserve an invariable standard by which to measure val-But there is no such monetary standard, and for that reason it is impossible to tell from a comparison of the prices of one period with those of another, whether the standard of living has been elevated or lowered. There is only one way of testing the matter, and that is to ascertain whether consumption has increased or diminished. In other words, nominal prices do not gauge the degree of prosperity attained by a community, is determined by volume of production and the quantity of consumable goods shared by the people. If a country is able to consume 600 pounds of iran, ner capita, per annum at 10 cents a pound, from is cheaper in that country than in those countries where one-sixth of that quantity is consumed at 5 cents pound

The individual may suffer from an ascending seale of prices, but the masses do not, if concurrently with the rise there is an increased production which enlarges the quantity of things consumable. That has been shown during the so-called boom periods, one of the most recent and striking of which was that which followed the election of McKinley in 1896. student of prices who will take the trouble to study the index numbers of recognized authorities will not that during the twenty-three years preceeding that date there was a comparatively steady fall from a high to a low level, and that during the seventeen years following the range has been upward. I have not had occasion to estimate the percentage of decline and advance recently, but a couple of years ago the drop between 1873 and 1896 was nearly the equivalent of the rise after that date, the apex of two comparative periods of rise being nearly on

Increasing Complexity of Living.

If we disregard the story told by price lists and concentrate our attention upon the factors of production and consumption, we discover at once that there was an enormous increase of the latter during the period of ascending prices. In order to comprehend the full significance of this statement we must disregard comparisons which deal with isolated articles or commodities and recognize the fact that the most striking phenomenon of advancing civilization is the steady march from the simple to the complex. and that man, as his condition improves, demands thousands of things, where he was formerly content or was compelled to accept a few. If the world had been satisfied to live on bread and meat, as its meager populations did during the Middle Ages, those products would be relatively

abundant and nominally cheap, for the comparatively small number that could exist to enjoy them But mankind. under improving conditions, diversifies its demands, and in the matter of alimentation becomes more and more epicurean. If this diversification had not taken place, had, for illustration, the simple diet of hog and hominy of the early settlers of the states which were a terra incognita when the thirteen colonies revolted been adhered to, hog and hominy would be much cheaper than they are at present, but there would not be ninety or more millions of Americans clamoring for a fair share of the choicest sugar-cured hams produced in the West.

The beginning of this remarkable diversification may be said practically to date from the closing years of the first half of the nineteenth century, when the hand product began to be superseded by the output of the factory, and it has proceeded without serious interruption, so far as the world at large is concerned for nearly 75 years. There have been periods of depression during this interval, but that fact does not impair the force of the observation that the productive powers of man have been steadily enlarging, and that each succeeding era of prosperity has been marked by enormously increased outputs of all sorts of articles and commodities in which the share of the average man is constantly growing greater.

Increases in the Food Supply.

This general enlargement of output is sometimes obscured by comparisons which take into consideration one or two, or only a very few staple articles, but even in the matter of foodstuffs a careful examination of all the facts will disclose that the volume available for the use of mankind has greatly increased. It may be shown that there is less meat or wheat per capita, but the relatively small deficiency they represent is more than compensated for by the numerous equally acceptable contributions to the table which permit the most illy paid laborer to vary his diet in a fashion undreamed of by the populations which enjoyed "cheap" meat and bread. It is easily demonstrable that other grains, the sugar. vegetables, fruit and fish, now so easily obtainable by all classes, more than offset the diminution of the supply of the two staples mentioned; and that their substitution for the unvarying bread and ment diet has proved highly beneficial to the human race, and is an important factor in promoting the inreased longevity which the insurance tables show us is one of the marked characteristics of the present age.

Turning from alimentation to the other causes which contribute to the physical well being of man we find even more convincing evidence that no matter what the price lists may record, the indisputable fact remains that the means of gratifying the very human desire for conveniences and comfort are continually being added to, and that the major part of the addition is enjoyed by the people at large All the great inventions have contributed to that end. The envious may think and say that the railroad king is the chief beneficiary of the system he created, but that is a mistake. The rich always enjoy apportunities to get about, and if they were very rich they

could travel invariously, but the railroad train has made it possible for the mechanic and the day laborer to share the luxury once strictly confined to the affluent. Once kines and barons dinch in the doubtful light of smoky torches now the artisan cars his evening meawhich is as likely to be appetizing or the barbarous spreads of baronial halls, under the softened rays of an electric lamp.

Effects of Rising and Falling Prices. It is obvious, then, that the price aberrations which fill so large a space in the public mind, while they cause great inconvenience and more or less hardship, do not have the effect generally assumed of hindering the progress of mankind. And least of all is there any ground for the assumption that rising prices cause interruptions of advancement. Prosperity and boom's always concur with ascending prices; depression is the invariable accompaniment of descending prices. The optimistic form of speculation, which takes the shape of discounting the future, never asserts itself unless there is a prospect of a rise, the pessimist if the king of the market when the signs indicate a fall. These are mere truisms, and need no illustration or statistical corroboration. They are indisputable facts known to all men

Whatever evil attaches to high ascending prices must be regarded as the outcome of muladjustment to changing conditions due to a cause beyond the control of individuals, communities or even nations. They are the result of a variable standard of The condition produced by the variation may be corrected, but there is no possibility-except a theoretical one-of preventing the variation while we adhere to an indeterminate measure. The individual by the exercise of economies, a process which is taintamount to the practice of self-denial may adjust his income to the change, or he may succeed in compelling some one else to make good his deficiency caused by the process of adjustment of the mass of production to the increase of the measure of values, but these efforts must, in the nature of things. prove powerless to arrest the operation of a universal phenomenon w'ich on analysis is seen to be responsive to the economic law of supply and demand.

Explanations Offered for Current Inerenses,

There are those who think that this economic law may be set aside, but the effort to do so will prove no more successful than that of the arrogant king who commanded the waters of the sea to recede. A variety of causes have been suggested to explain the rise of prices since 1896, and a public unwilling to investigate has demanded their abatement or removal. But the experiences of recent years unmistakably point to the fact that while the things complained of and denounced may be evils, their elimination would not have the effect desired. It is said that the tariff is responsible for the increased cost of commodities in this country but those who make this assertion is nore the fact that the McKinley Toll which was enacted into law during the period of falling prices, between 1873 and 1896, was powerless to accest the decline. The index numbers show on

usively that while the measure unhouldedly had the effect of stimulating protected industries within the horders of this country the products of those multistries shared in the universal deline. This being the case, it would have been about as reasonable to hold the McKinley high protective taruff responsible for the fall in prices after its enactment as it is now to assert that the later Dingley and Payne-Addrich measures around for the present high total.

Effects of Taxation.

Another explanation offered is that connected with increasing taxation, but it is easily demonstrable that that phenomenon was in operation on a relatively greater scale before the turn of the tide in 1896 than since that date. Americans who forget that it was during the period of falling prices that our appropriations mounted at such a tate that the nickname "billion-dollar" Congress was bestowed have poor memories. One of the strongest points made by bimetallists during the discussion over the standards was that the effect of falling prices was to disguise or conceal increasing taxation. From a monograph, which I wrote in 1895, I extract the following, the figmes of which were derived from the Statesman's Year Book:

In 1873 the total actual payments out of the British excheniper footed up £70,-714,448. In 1891 they had increased to £81,262,846. In 1871 the population of great Britain was 31,622,858, in 1894 it was probably 33,600,000—the census of 1891 made it 33,104,975. A simple calculation shows that the per capita expenditure in the first-mained year was £2 48 9d and in 1894 it had increased to £2.98 68d.

The view of the English and Continental bimetallists that increasing taxes in the face of declining prices was pernicious seems far more rational than the assumption of the critics of the present high prices, who may reasonably be suspected of confounding cause and effect. When prices were des ending and nominal taxes were rising there could be no doubt that the bunden of the taxpayer was being increased both relatively and absolutely, but when the expenditures of a government are only nominally increased during a period of ascending prices the increase may be more apparent than real. If the cost of government as expressed in dollars and cents is increased fifty per cent during a period in which properly constructed tables of index numbers show that the general rise of prices has also been fifty per cent, the obvious inference from the concurrent upward movement is that the rising prices compelled ingovernmental expenditures: ereased but on the other hand, if governmental expenditures show a nominal increase during a period of descending prices, there is no escape from the conclusion that legislators indulged in extravacance.

Growth of Expenditures.

Under the circumstances we are compelled to dismiss governmental extravagance from the list of causes that may properly be quoted to explain the nominal price elevation. Excessive expenditure by governments is an evil, and one which ofter hears with severity on the people governed, but it does not have the effect which some at-

tribute to it. If it did we would not be able to show that nearly all civilized governments were greatly increasing their expenditures during the petiod of descending prices without in the least tending to arrest the downward trend. Although it is impossible to furnsh statistical evidence to support the assertion, yet it is undoubtedly true that individual extravagance was expanding relatively as rapidly during the period of descending prices as it has been since 1896. The exhibitions of extravagance have been more spectacular, but the fact that production was greatly enlarged between 1873 and 1896, and that the increase was more rapid than that of population, establishes that consumption per capita increased, and that is only another way of stating that mankind was becoming more extravagant unless we assume that men were denied the necessaries of life before 1873.

Influence of the Middleman.

Another in the list of thirty-two, none or less, causes advanced to explain the rise in prices since 1896 is the multiplication of muddlemen. There may be too many, and a host of them might be eliminated if the disposition to dispense with them existed. But it does not, and the fact that the middleman constantly increases in numbers, and that he devotes himself largely to making commodities absolutely dearer by putting them up in attractive packages and selling them in pleasant and sanitary surroundings clearly establishes that he fills an economic want That his rewards when successful are carned, is proved by the fact that he works mostly in a field in which monopedy is impossible, and that he is not always successful is shown by the table of failures which tell the story of bundreds of thousands of victims of misplaced confidence in their ability to earn a living by serving the convenience of their fellow man.

But whether an evil or a positive economic benefit, as some economists assert, the middleman flourished and multiplied as greatly during the period of low prices as he does now Statis-Les abundantly support this assertion, and if there is any disimiliration to consult dry figures the distribes of men like Carlyle may be drawn upon. And let us not forget that Edward Bellamy wrote his "Looking Backward" in 1888 and that one of his alluring remedies for the wors of that day was the elimination of the middleman Curiously enough Bellimy's dream of riest central depots is in constant process of realization, not by the adoption of fantastic socialistic methods, but I'rough the operation of unrestrained individualism which is providing the 'ig department stores and placing within the reach of constantly increasing numbers articles, pleasures and conveniences which in his boldest Hights of imagination be fulled to fore-

Influence of the Gold Supply,

I repeat and challenge contradiction that every phenomenon but one suggested as an explanation of rising prices was in operation during the period of decline. Some of these alleged raties are too purelle to waste attention upon, but all of them were manitest between 1872 and 1896, during which period the drop in prices was as

great as the rise since that date Sanerbeck's index number for the period 1864-73 was 102, for the period 1885-94 it was 69. Middling Orleans cotton in 1872-73 was quoted at 9.65 cents, in 1893-94 the average was 4.25 cents. In 1895, near the culmination of the period of low prices, the American product of pig iron was 6,657,888 tons, in 1907 the output was over 27,000,000 tons. is there any one prepared to assert that the world is not in belter case with the enormously increased production of the high price era than it was when the relatively as well as absolutely small product of the low priced period was recorded? If there is any one so hold, let him recall that the output of pig iron increased fourfold while our population increased a little more than twenty-five per cent. If he does ne will probably conclude that four times as much iron at a high price is more desirable than a fourth of the quantity at a low price.

It is not my purpose in presenting this argument to intimate that economies are undestrable, but to point out that it is idle to attempt to combat a universal tendency by the application of a local device. The rise in prices since 1896 has been worldwide, and so was the fall during the period between 1873 and 1896. Economists from the time of Adam Smith down to the day when public discussion obscured the causes were agreed that previous alternations from high to low price levels were due to the abundance or scarcity of the hasic money metals. They also explain the recent changes which have come under our observation. When prices were falling between 1873 and 1896, the quantity of metal on which the Western world's legal tender system was based was constantly diminishing since 1896 the store of basic money metal has been enormously increased and prices have risen. It is the only cause for the decline and rise of prices in the two periods, an analysis of which can be made without disclosing contradictions of the sort contained in all the other explanations offered

For the reasons given 1 am inclined to believe that a discussion of the cost of fiving in California will disclose no facts of value which are not already known. We may, as a result, reach the conclusion that we are individually excursions that we are individually excursions and that we would individually be better off if we curtailed our expenditures, but unless we attack the question in a large way we shall be no nearer determining the cause of the high range of prices, or whether the world would be in better case with how than with high prices.

THE DARWIN SILVER-LEAD MIN-ING DISTRICT, CALIFORNIA.

California, rich in other metallic resources, has never been highly broductive of lead ore. Most of the lead produced has come from Cerro Gordo, Darwin, and Modoc districts, all in Index County, in the eastern part of the State. The Cerro Gordo district has furnished by far the largest output, having yielded during its most prosperous years \$7,000,000 in silver-hearing lead.

The Darwin district has probably produced between \$2,000,000 nad \$3,000,000, according to a report just published by the United States Geological

Survey (Bulletin 580, Part A, by Adolph Knopf). Darwin, the principal settlement of the district, is situated 24 miles southeast of Keeler on Owens Lake, the southern terminus of the Nevada & California Railroad. The name of the district is said to have been derived from Dr Darwin French who in May, 1860, led a party of 15 men in search of the Gunsight lode. This lode was a mythical silver deposit, which at that time was widely believed to have been founded by the emigrant party that was lost in Death Valley in 1850. In the early part of the decade between 1870 and 1880 silver-bearing lead ores were discovered in the vicinity of Darwin. A town soon sprang up here, and it is sald to have had at one time a population of several thousand inhabitants. Three smellers were built in 1876 and a heavy production of base bullion was made. These furnaces, after the activities the first few years, were operated in a desultory way only. Mining and smelt ing expenses were high, because prior to the completion of the railroad to Keeler in 1883 all freight had to be brought across the desert by teams from Los Angeles, a distance of 275 miles. The richer and more easily mined ore budies were early exhausted and the district soon lapsed into stagnation occassionally interrupted by periods of activity.

In the early part of 1912 interest in the district was renewed and considerable activity was displayed. It is locally hoped that the introduction of early hoped that the introduction of modern machinery and the systematic exploration work now being undertaken at some of the old mines will cause a permanent revival of the mining industries.

The geologic feautres of the distant are of somewhat more than local interest. The ore bodies, ranging from contact metamorphic deposits high-temperature origin to fissure veins formed at more moderate temperatures, are inclosed in lime-silicate of late carboniferous age. The lime silicate are due to the metamphism phism of originally calcareous and magnesian beds to wollastonite, diopside, ad grossularite rocks and are the result of the invasion of the region by quartz diorite of probable Cretaceous age. The inclusure of the ore hodies in strata composed of lime-silicate of this kind is the distinguishing feature of the Darwin district. Somewhat later than this metamorphism, which affected the district as a whole, came the formation of the ore bodies. They were produced by metalliferous vapors and solutions given off from deep-seated hodies of molten rock from which the quartz diorite now seen at the surface crystallized.

The ores consist of silver-bearing galena, together with minor pyrite and zine blende, commonly associated with a gangue of calcite and flourite. As a rule the galena is considerably oxidized to lead carbonate and sulphate. There is, however, no evidence of important downward concentration silver, lead, or zine through the action of oxidizing solutions, as, indeed, appears unlikely from the prevalence of calcite in the deposits. From this it follows that the value of surface ore is an index of the probable value of ore masses found during deeper exploration

Plans are complete and in the hands of the owners who will do the work by Day Labor.

SAN FRANCISCO—Flats, 2 story and base, fram, \$5,000. Architect, £, £. Young, 251 Kearny street, S. F. Owner, Thomas Scoble, 362–14th avenue, the huilding will be erected on the east side of 9th avenue near Ballon, and will have a frontage of 30 feet by a depth of 55 feet. There will be two flats of five and six rooms. Interior flats of five and six rooms.

harsh will be of pine and redwood with some hardwood floors, Open her places and tile mantles will be used. Bath rooms will have the wainscot and composition floors. Automatic water heaters will be installed. Exterior of the huilding will be covered with cement plaster on metal lath. Plans are complete and the work will be done by Day Labor. Materials are now being ounclassed.

GARAGES.

SAN FRANCISCO - Garage, 2 story and base. Class A construction, cittact none. Dyrer, H. A. Schroeder. 3151 Sacramento street, S. F. The building will be erected on the north side of Green street east of Octavia, and will have a frontage of 55 feet and a depth of 137% feet. Construction will b∉ fireproof with reinforced concate fundation, brick exterior walls and steel roof trusses. There will be to often storage source effice and a unudetely equipped machine shop Interror will be finished in pine with a coment floor. Special gasoline storage tanks wil be installed. Exterior of the building will be faced with ce-nert plaster. Pigns are complete and a the hands of the owner who will the work by Day Labor.

SAN FRANCISCO-Garage, 1 and 2 story and base. Class A construction, \$10,000. Architect, Sylvain Schnaittaher, First National Bank Bldg., S. F. Owner, G. P. W. Jensen. The hullding will be erected for the Taxi Cab Company of California, and will occupy the northeast corner of Bush and Larkin streets, covering an area of 137% by 137 to feet. Construction will be fireproof throughout with a steel frame, reinforced concrete walls, floors and roof slabs. There will be steel roof trusses. Plans provide for a large amount of storage space and a machine shop. Metal window sash and frames will also be used. Exterior of the building will be faced with cement plaster. Plans are complete and figures are being taken.

-HALLS & SOCIETY BLDGS-

SAN FRANCISCO-City Hall, 4 story dome and base. Class A construction. Architects, Bakewell & \$1.500.000 Brown, 251 Kearny street, S. F. Owners, City and County of San Francisco. liids were opened at the last Wednesday afternoon meeting of the Board of Public Works for the metal lath and turring and plastering for the new city Three propositions were asked heat1 for: First, the plastering; second, the metal lath and furring, and third, for both metal lath and furring and plastering. Gustave Johnson was low on proposition three at \$171,000. A complete list of the bids received will be found under the heading of San Francisco in this Issue

Contracts awarded.

KLAMATH FALLS, ORE.—City Hall, 2 story and base, brick and stone, \$36,8-M4. Architects, Veghte & Co., Klamath Falls, Owners, City of Klamath Falls, Controctors, Cofer Bross, Klamath Falls, Contract price, \$36,884.

COLUSA, COLUSA CO., CAL.—Hall of Records, 2 story and base, reinforced concrete, \$50,000. Architect, Henry C. Smith, Humboldt Bank Bldg, S. F. Owners, Colusa Courty. Con-

tractors, Williams Bros. & Henderson, Holbrook Bldgs, S. F. Contract price, \$15,585. A complete list of these figures will be found under the heading of Sacramento, Stockton and Northern California.

HOSPITALS

NAPA, NAPA Co., CAL.—Hospital dairy buildings, frame and concrete, Cost not stated, Architect, State Architect George B. McDougail, Sacramento. Owners, State of California. Plans have been completed by the State Department of Engineering for a new dairy building and a concrete silo to be erected at the Napa State Hospital. Plans are now out for figures and may be secured from the State Department of Engineering at Sacramento. Bilds will be opened on June 3rd. An official proposal appears in another column of this issue.

TALMAGE, MENDOCINO CO., CAL.—Gas holder and tank. Cost not stated, Architect State Architect George B. McDongall, Sacramento. Owners, State of California. Bids will be opened on June 1st for constructing a gas bolder, framing and tank at the Mendocino State Hospital at Talmage. Plans can be secured from the State Department of Engineering, Sacramento, An official proposal appears in another column of this laster.

STOCKTON, SAN JOAQUIN CO. CAL—Dairy buildings, frame and comcrete. Cost not stated. Architect, State Architect George B. McDougail, Sacramento. Owners, State of California. Bids will be opened on June 4th for constructing new dairy buildings at the Stockton State Hospital. Plans can be secured from the State Department of Engineering, Sacramento. An official proposal appears in another column of this issue.

SACRAMENTO, CAL — Hospital group, 1, 2 and 3 story and base, rein-forced concrete or brick. Cost not stated, Architect, R. A. Heroid, Forum Bldg., Sacramento, Owners, Sacramento County, Architect Heroid basive been commissioned to prepare plans for a large group of modern hospital buildings to be erected on the old infirmary site. The cost and nature of construction have not been fermined as yet. Further mention will be made of the work as the plans progress.

SAN FRANCISCO — Hospital yard work and lighting fixtures. Cost not stated. Architect, City Department of Architecture, Temporary City Hall, S. P. Owners, City and County of San Francisco. Bids opened for the yard work, brick walls, fence work, etc., at the San Francisco Hospital show C. L. Wold low on the four propositions. He will probably be awarded the work. The Ickelhelmer Bros, were low on the lighting fixtures at \$12.786, A complete list of these figures appears under the heading of San Francisco in this issue.

Contracts Awarded.

NAPA, NAPA CO., CAL.—Pay cottage, 1 story, frame and concrete Cost stated. Architect, State Architect George B. McDougall. Sacramento. Owners, State of California. Contractors McSheehy Bros., S. F. Contract price not stated.

HOTELS.

SAN FRANCISCO-Hotel, 7 story and base, brick and steel, \$70,000 Architects, Smith & Stewart, 241 Kearny street, S. F. Owner, A. O. Stewart, Tue building will be erected on the north side of O'Farrell street east of Taylor. having a frontage of 27% test and a depth of 137% feet. There will be one store besides the lintel office and lubby in the first floor. Upper Boors will contain a total of 66 rooms, all of which will have private haths rior finish will be of pine with some ornamental plaster in the lobby Plans provide for steam heat, elevator service and a hot water supply. rooms will have tile wainscot and composition floors. Exterior will be faced with red pressed brick trimmed with white terra cotta. Plans are complete and figures are being taken.

SAN FRANCISCO-Hotel, 2 Story and base, frame, \$14,000 Architects, Phillip Schwerdt & Co., Phelan Bldg Owners, Hyman and Isaac Wolf The building will be erected on the west side of Sixth street south of Howard, covering an area of 25 by 108 feet. Interior will be arranged for a total of 60 rooms and a number of public baths. Trim will be of pine and redwood. BUILDING NOTES.

The average number of stories in buildings on Manhattan is 4.8. In the downtown district, where most of the skystrapers are, the average is but 6.4

The most expensive apartment in the world is a certain floor of the twelvestory building at Eigthy-first street and Fifth avenue, the rental of which is close to \$25,000 a year. The building stands on the most costly land available for such houses, and contains every known device to render it safe and comfortable. Land on Fifth avenue is worth about \$100 a square foot, and the site of No 998, which is the number of the apartment house, contains 12,you square feet. No other building of equal size in the metropolis has so heavy a ground charge to carry. The represents an investment close to \$5,000,000. Divided between the twelve floors give \$250,000 a floor.

. Fifteen nations have officially adopted the new standard carat of 300 milligrams for use in weighing precions stones.

Slabs of natural eark, expanded to more than twice their original size, has been invented in England for cold storage insulation.

Firms desiring news from certain lacalities like San Francisco, Los Angeles, Portinad, Scattle, etc., will find all such Hens, commencing on this page, all carefully classified as to location. These same Hens are repented in the fore part of the news department, under dirithet hendings, such as Banks Churches, Hotels, etc.

LIBRARY-3 story and base Class A construction, \$1,000,000. San Francisco. Architect, George William Kelham, Sharon Bldg , S. F. Owners, City and County of San Francisco judges in the San Francisco Library Competition last Friday announced the selection of George William Kelham, Sharon Building, as the architect for the new million dollar library to be elected in San Francisco's Civi - Center. Cass Gilbert of New York, Paul Cret of the University of Pensylvania and Hon. James 11 Phelan acted as judges. The decision was reached after nearly a week of deliberation. The competition was invitational and was limited to San Francisco aichitects. Six architects were invited, including George William Kelham, Edgar A. Mathews Albert Pissis, Ward & Blohme, Reid Bros., and G. Albert Lansburgh. As a reward for his design Mr Kelham will be commissioned by the Library Trustees to complete the work, while the other five contestants will be awarded \$1,000 each. Plans were placed on exhibit in the Assembly Hall of the Phelan Bullding where they at once attracted a large number of visitors, many of whom were among the leading architects of the city. An expression of general satisfaction with the selection of the winning design was heard from all sides. Drawings on exhibition show the principal elevations and floor plans. There is a ground floor, the main or second floor and g third flood. The winning design is an exceptionally meritorious piece of work in the classic style, while the rendering is beautifully done. This is

true of nearly all of the designs submitted. The library building will be erected on property bounded by Lukin Hyde, McAllister and Fulton streets Hyde street will be cut through to what is now City Hall avenue

APARTMENT HOUSE—3 story and base, frame, \$30,000, Sin Flancisco Architect, Frederick H. Meyer, Bank ers' Investment Bldg. S. F. Owner Mrs. Bertha overfeld. chitect for the new million dollar library to be erected in San Francisco's Civic Center. Cass Gilbert of New York, Paul Cret of the University of Pennsylvania and Hon. James D. Pheian acted as judges. The decision was reached after nearly a week of deliberation.

The competition was invitational and was limited to San Francisco architects Six architects were invited including George William Kelham, Edgar A. Ward & Mathews, Albert Pissis, Blohme, Reid Bros. and G. Albert Lansburgh. As a reward for his design Mr Kelham will be commissioned by the Library Trustees to complete the work while the five second prizes will be awarded \$1,000 each. Plans were placed on exhibit in the Assembly Hail of the Phelan Bidg, yesterday at noon and at once attracted a large number visitors, many of whom were among the leading architects of the city. An expression of general satisfaction with the selection of the winning design was heard from all sides.

Drawings on exhibition show the principal elevations and floor plans. There is a ground floor, the main or second floor and a third floor. The winming design is an exceptionally meritorious piece of work in the classic style, while the rendering is beautifully done. This is true of nearly all of the designs submitted.

The library building will be erected on property bounded by Larkin, Hyde, Hyde McAllister and Fulton streets. street will be cut through to what is now City Hall avenue.

BUILDING CONSTRUCTION SINCE FIRE.

Unilding operations from May 1906. to April 30, 1914, as reported by Bureau of Building Inspection of the Pourd of Public Works, show that 50,-377 buildings have been erected at a cost of \$252,761,742. The following Is a list of figures as compiled by the Emigair:

THE LIABILITY LAW.

Cause For Resistance To The Act Dis-Cassed fly John Miller White.

A Mason and Builder's Analysis of Existing Conditions in Our Courts nf Justice.

The action that is being taken in the courts to overthrow the comployers liabillty law of this state, is one that was to be expected. There is a deep and far reaching reason for it. It appears to me that there is a meaning. both in the law and in the opposition to it, that has not yet, so far as I have seen, been called to public attention. The liability law is in effect a court

created for the purpose of determining the instice of causes which it is fitted to decide because it is informed of the nature of the cases on which it is called to act. It is only one of many such courts for the purpose of administering justice, that in recent times have been created, and in many states for the purpose of determining only such cases as they are constituted to understand; and they are able to be just not only because they are free to act on the merits of the causes brought Lefore them, but because they may act promptly, and that is the half of jus-

So all of these commissions courts. They are prophetic of the courts of the future, and it is the principle of such a court, free and untrameled, and thus having power to do justice, that is opposed by the interests They see, as that are against them. we all may see if we will, that the courts that we have known, and the system of jurisprudence that they represent, is passing away, by evolution and not by revelation. The cold arm of technicality that is reaching its clammy fingers out of the darkness of the middle ages, and extending over our modern enlightenment, is dving as it should, and a new system of jurisprudence is taking its place

The old system, or the courts as we have been taught to know them, and in fact our entire system of law and court procedure, grew up in the decaying days of Rome, fittingly constructed in harmony with the spirit of their life. In an age of great wealth in the hands of a few and with millions of struggling poor; constructed so that it worked, by its quibles and delays, continual injustice just in proportion to the poverty of the litigant And so it has continued till now with but slight variations of outward shape in all the nations of modern Europe as well as ours, to automatically amass the wealth of the people in the hands of the rich and powerful. This advantage has continued in favor of the rich for eighteen centuries, and may truthfully Le said that it was made so intuitivly by the spirit of its creators, as every work must partake of the nature of And this work has its authors. operated, and dues so operate now as tie most cunning instrument of inequality and injustice that could be conceived in the mind of man. And so it is that the powers in the world that profit by inequality, and who have so long profited through the operation of this system, are to be expected to resist the forces of higher civilization that are sweeping it away.

The higher idea of justice of our recent times, which regards the right of every man to have his cause judged without unnecessary expense or delay. has at last found a way to change our system of law procedure by gradually erenting a new system to take its place. and it seems like something of a mockery for the old and dying court to pass on the question of the right of the new to exist or to come into being It seems as if a dead branch on a tree would claim a right to deny the parent tree the right to grow green branches Ent time will rapidly pass, and it will not le long till all civil cases will be tried by tribunals fitted to understand their nature, and which, Lecause of power to understand the evidence, will he able to do justice.

But while the subject cannot be more Han sketched here, this appears to be the true essence of the growing system of adjudication by commissions. We have among us, and particularly here in California, some men who, in terrat times have been diligent workers in the cause of equality, and are they who preach near violence from street corners, but they are those who have fought every form corruption, and who are creating this system that will, by its operation. tend to bring about more perfect equality of right. And there are among these some who have been singled out for particular vilification and abuse. by those who profit by protracted litigation and delay. But they are in truth not disturbers but benefactors, and California owes honor and abuse to her leaders in this march of progress. Such names as Roosevelt. Henry, and Johnson, will long be remembered with honor for their struggle against the entrenched past. There is no question that a great change is working in the hearts of the people. and for what reason we do not know. but we do know that it is true that California is now influencing economic thought and action far beyond her own borders. It will become her to remember that her work is progress, and that honor comes to her now on account of it, and the more will come to her in the future. And the history of all progress will unite to teach her that any failure on her part to maintain the example already given will be charged to her discredit.

JOHN MILLER WHITE.

The California Railroad Commission has taken up the question of the Pullman car rates with reference to the tipping system that is forced upon the public by the employees of that com-And as it has dealt with the Southern Pacific Company and Wells Fargo Express Company it may he expected to deal with like effect in the case of this monopoly.

The Commission has given the company thirty days in which to remedy the evils complained of or the Commission will start an investigation where the trouble is. It rightly says that the company should either pay its employees a living wage or if it is too poor to do this that it should have its rates and charges raised.

Commenting upon the practice of the company the Commission states that "It is impossible for this Commission

to reach a conclusion other than that the Pullman Company deliberately attempts to pay the employes which it hires from the gratuities given by the

While this Commission is not attempting to reform the common inclimation of humanity to get a little better treatment by tipping, and does not feel called upon to discuss the morriety of gratulties, still we do believe we are compelled to consider the duty of this company with reference to turning to its own advantage the tipping habit."

The Commission further states that women travelers receive less attention than men, because the tips are less and tourist car passengers receive inferior service to those of the pullman cars. Commenting further the Commission

Complaints have come from the employees of the company themselves to the effect that under the wages paid been they must get tips to live, and bean they must get tips to live, and that they are expected by their employees to get such tips. It is impossible for the Commission to reach a conclusion other than that the Pullman Company deliberately attempts to pay its employees from the gratuities of the public.

This commission does not feel called upon to question the propriety of gratuities, but we do believe that we are compelled to consider the duty of this company with reference to turning to its own advantage the tipping habit

"It certainly is a commentary on modern lousiness that a company as rich and powerful as this one in question should feel inclined to strop to the discreputable practice to which it feels called upon to resort

"It is our consion that the time has possed in this State and in this State of the state and in this State possed in this State and in this State of the state of

This report is a commentary on the progress of the country since the time of Grover Cleveland. In 1893 the town of Pullman, Illinois, was owned completely by the Pullman Company The employes lived in the company's houses or were buying them from the corporation. They traded at the company's store. In fact they were the servants, body and soul, of the corporation. Labor conditions became so had that the employes went out on strike. The first thing the Pullman Company did was to run a mail car into the town and when the train to which it was attached was stopped by the strikers the company's officials appealed to the President of the United States that the strikers were interfering with the mail. Cleveland promptly sent the federal troops to the place, the trains were permitted to run and the strike was over. The Strikers had no rights that the company was bound to respect and they were compelled to make their living the best way they could

Now tidings have changed. Even the porter is considered a citizen, he is entitled to a fiving wage and the corporation is not allowed to high his carriings and pay dividends on watered stock and money that was never invested. No wonder the Chronicle lowls about too many commissions. It is the Balforad Commission and II a Board of Control that has hit its the lathical conditions to special privilege and these are the commissions at would like to aboilsh.

The present administration shows what really competent men can do when they are placed in charge of governmental affairs when they have the back hone to do it. Never again will the Southern Pacific and Wells Fargo and the Pullman Company and all others make people believe that all

the wisdom if the world is lodged in their corporate heads. And it is to be hoped that never again will a majority of the people pull blindly the juggernant of special privilege harnessed by political prejudice and believing as gospel truth the flapoloodle of a lot of pointful hirelings.

THE LAKE WASHINGTON CANAL LOCKS.

An important work now nearing completion is the great boks of the Government canal at Sathoon bay, by means of which slopping will be able to pass from Puget Sound at Seattle to Lakes Washington and Union. The works are so far advanced that Te first ship is expected to pass through the waterway early in 1915.

The public mind has been so filled with the story of the construction of the Panama Canal and its great locks at Gatun and elsewhere, that it is not to overlook the fact that several other works of this character of great magnitude are also being carried out. The Lake Washington canal and locks are a case in point. The lock is \$25 feet long, 80 feet wide on the inside and 56 feet high. The walls of concrete are 53 feet in thickness at the bottom and 8 feet at the top. This structure is known as the Bik Lock. The Small Lock is 30 feet wide and 160 feet long The latter is being built for the use of small boats, and, of course, it will result in the saving of much expense, since a large part of the traffic is of such size as not to call for the use of the greater structure.

When the looks are finished the level of Lake Union will be raised to twenty-one feet above the high water mark, and both this lake and Like Washington with the factories along their shores, of which there are many today with the prospect of a great many more in the future, will be in direct water communication with the Pacific. Our great advantage of the new works is that since the water in the lakes is fresh, ships will be able to pass through the locks and relieve themselves of barnacles and other marine growths which will drop off from their bottoms, leaving them clean for the next voyage. Also, the canals will have a distinct value to the Navy, whose ships of the medium and smaller sizes-all ships, in fact, except the larger dreadnoughts-will be alde to enter the fresh water lakes if emergency or other causes should render it desirable

The first estimate for this work was \$2,275,000 for the locks, \$1,000,000 for the herks, \$1,000,000 for the dredging. The rost of the locks is being paid by the United States Government and that of the canal by the city and county.

INDUSTRIAL ACCIDENT DECISION.

The Industrial Accident Commission bas just handed down a noteworth decision. Buth vs. Southern Paeth Company, in which it has held that the Workmen's Compensation Act covers certain classes of the employees of that railroad

The applicant was the widow of thus B. Ruth, who was accidentally killed no January 17, 1914, while employed by the Southern Pacific Company as a truck builder and repairer of trucks for becometives in its roundhouse at

Roseville. Ruth was repairing a switch engine which had been with-drawn temporarily from service in the Operating Department, and which had been used in handling both interstate and infrastate commerce.

The Southern Pacific Railroad maintained that the accident did not come under the Workmen's Compensation Act, but that it was governed by the United States Employers' Liability baw. In making its decision, the Industrial Accident Commission held that the Congressional Act covered injuries only to tuose working-men employed by interstate rallroads while such employees were actively engaged in interstate commerce. Im the other hand, if the raildroads were not engaged in interstate commetce at the time and the place of injury, and if the accident occurred while the employee was not engaged in interstate commerce, then

The Southern Pacific Company will undoubtedly appeal the case to the higher courts.

HUNDREDS OF MILLIONS OF WASTE

At the first annual banquet of the National Association of Waste Material Dealers, held in New York city this week, it was brought out that by collecting and utilizing waste products the members of the association transact an annual business of \$700,000,000 The utilization of cotton-seed oil and of cotton seed, until very recent years a mere waste product of the cotton crop, is was pointed out, is now valued in the United States alone at \$50,000,-000 a year. Curtis Guild, ex-ambassador to Russia, noted that we are now exporting sisal strings to Europe to be turned into tooth laushes; that we are using the worn-out painter's brush, soaked with white lead, by cleansing and using the worn bristles to provide mexpensive and durable scrubbing brushes, while exporting American cotton stockings to Europe, where they are unraveled and used as a cheap packing in the manufacture of graphophones and electrical machinery, while patched and darned European stockings, not having any other use, are exported from Europe to this country for their only possible use as paper stock. The exports and imports of waste material are not yet thoroughly reported by the department, and even the commencement of their appearance in the official publications of the United States thevernment dates back but a few years. For the calendar year 1913 we exported cotton rags to the value of over \$500,000, paper stock other than cotton rags to the value of over \$800,000, woolen rags to the value of \$1,000,000, scrap iron to the value of \$1,200,000, old and reclaimed tubber to the value of \$1.600 -000, and scrap brass to the value of over \$2,000,000. The figures of the imports of waste materials from foreign countries are even more striking. the year 1913 we imported scrap from to the value of \$500,000, old copper to the value of \$1,000,000, silk waste to the value of \$3000,000, old rubber to tie value of more than \$3,000,000, cotion rags to the value of \$3,000,00, and other paper stock which was neither cotton rags nor wood pulp to the value

of nearly \$5,000,000,-Bradstreet's.

BOTH THE OWNER and the Architect are particularly interested in all kinds of building materials, power and heating systems, building specialties, every of building materials, power and heating systems, building specialties, every accessory that goes into their project. Every issue of the Building and Industrial News contains hundreds of new building and construction reports giving the names and addresses of both the owner and the architects. Both the owner and architect receives a copy of the Building and Industrial News containing mention of their individual job conspicuously marked. Thus the builder and the architect have in their hands not only the news items of their particular project, but also the announcements and the advertisements of energetic business men who have goods to sell that are necessary to construct and equip the undertaking. IS YOUR ADVERTISEMENT AMONG THESE?

Catarrh Can Be Relieved

HERE IS NO NEED for you to continually suffer from Catarh and Cold in the Head. It makeryou miserable, doesn't it? You really don't care whether thing: go right or not and youwonder when you'll ever get over it. And you will not get over it mitly oug get the Clover Leef Gatarh Remedy, and use it. It will relieve you, and you'll wonder why you had not used it sooner. We are so positive that this will relieve you of your Catarh or Cold in the Head, that we guerantee you satisfaction or we will refund your money.

Editorial Comment.

Out of a list of about 75 cities reporting to the American Chicago, a loss of about 13 million dollars or something more than 16 per In New York the loss was comparatively small, in Chicago the decrease was greater, while in the large building centers there was a general decrease in building operations. While we may think things are quiet here on the coast the figures show that conditions here are as good or better than anywhere else. Seattle at least, shows a substantial increase. Particulars are found in the following table:

	April.	April.

Joseph Knowles, A Boston artist, entered the Maine woods last year absolutely maked and came out at the end of sixty days clothed and aparently in good health. He demostrated that civilized man with any knowledge of woodcraft could exist as

his barbaric ancestors had done and

gain a living from the wilds of nature. Bill Elliott, a Maine Woods guide, bus an interview in the New York World in which he has an idea to enter the city, the brick and mortar wilderness as he calls it, without a share or a hair cut, without a thing in the world except some ragged clothes to over the bare pelt. His idea is to demonstrate that the average man has a heter show to make a living in the country than in the city.

In other words that the lands holds out the squarest deal to the man that has the right kind of stuff in him and is willing to depend upon himself. That there is always a living to be gained from the soil. And that white one may have to endure physical hirdships to the average person there is more competunity than in the city.

THE MERCHANT TONNAGE OF THE WORLD.

The latest figures showing the tonnaise of the merchant' fleets of the principal maritime powers, prove that threat Britain still holds her commanding lead, with a tonnage nearly one-third scrater than that of all the other maritime powers combined. Thus threat Britain possesses 20,275,291 tons, thermany, 4,985,746; United States, 3,149 136 tons, the greater part of which is domestic shipping: Norway, 2,475,721 tons, France, 2,216,504 tons; Japan, 1,700 002 tons, and Italy, 1,571,761 tons,

Landscape Architect and His Profession.

Expert Services, Training, the Character of Work Charges, Planting and Principles. Howard Eurts Weed.*

Reprinted from Pacific Builder and Engineer.

Landscape gardening is a comparatively new profession, which may be said to have had its buth in America with the formation of Central Park in New York City. In the growth of the metropolis a large tract of land situated in what was then the upper portion of the city was given for the formation of a public park, largely owing to the tart that the land was so rocky that building operations were considered too costly. No one unfamiliar, with detailed history of this famous park can realize the enormity of the task so successfully carried out by the late Frederick Law Olmstead. This park is the pleasure resort of thousands annually and with many of these persons it is the only touch of The nature which they ever Centennial Exposition in Philadelphla marked a step forward in the development of landscape art, and it was here for the first time that the public saw what results could be obtained when flowers, shrubs and trees are blended in harmony

In the years following the Centenmal considerable interest was taken in gardening in the eastern states, in gardening in the eastern more especially in the vicinity of Boston, where a series of public parks was established. But it remained for the World's Fair of 1893 to awaken the people of the west to the fact that there existed such a thing as outdoor art. What visitor does not remember with pleasure the delights of the gracefully curved walks and drives of the White City, the touch of wildness of the wooded island, or the blending of the formal exposition buildings with their surroundings". These features of the exposition remain in memory long atter the exhibits have been forgotten.

Present and Puture Interest.

Wr thus see that it is only in the past few years that much general interest has been taken in landscape gardening. Now, however, the public are taking more interest in things of beauty and works of art. Examples of good landscape art have called attent'on to the artistic effects which may be produced by the flowering shrubs, But the present interest has only be-As the country becomes older 22.11.01 greater wealth enables the establishment of country estates developed by special artists who devote their lives to the sludy of flowers, shrubs, and teens, and how they can hest be absend in their relation to each other and their surroundings to make an harmonions and effective landscape

The nearry and attractiveness of a bonne I'es not alone in the house, for however beautiful or costly this feature may be, it cannot be considered alone, but as a pirt of its surroundings. A framework of those is, shrubs and trees is needed in order to blend the whole in barround. It will pay anyone contemplating the planting of even a few trees and shrubs to employ a landscape architect for this work. He will then be reasonably sure of a

good into well done and as the landscane probatect obtains. wholesale rates on the purchase of stock, this saving above will generally more than pay for his services. At the present time no one thinks of building a house without engaging an architect to draw a plan of the building and supervise its constituction. Yet it is only in recent years that this has been done. But in the future the importance of a planting plan of the surrounding grounds will be recogbized just as surely as the importance of a building plan is recognized today.

Function of a Landscape Expert. At first thought it may seem an easy matter to idant out the grounds surrounding a building to trees and shrubs. And so it is. A child can place the roots of a flower or shrub in the ground and have it grow. In the same manner it is an easy matter to Lang works of art upon the walls of an exhibit room. The paintings being at hand, with the proper number of hooks in the wall, all that is needed is a step ladder and a helper to hand up the works of art and the job is soon over. I have never seen an art exhibit arranged in this way, so do not know how it would look, Bot I notice that at every art exhibit a committee of connoisseurs is appointed to numerly arrange the exhibit. If seems that some paintings show best with a certain amount of light others with the light coming from a certain direction, and so on. Unon this account the hanging committee will spend days and even weeks in considering the proper placing upon the wall of a few paintings.

If all this trouble is important in the placing of a few landscape pretimes in order to please the eve for the passing moment, how much more important is the placing of the individual specimens of nature in the making of landscape. Here we deal with the real things, the creation and representation of God, and not simply with a lew colors but upon a canvas by a man in imitation of nature. We are also making an arrangement, not for the passing moment, but practically for all time Some flowers and shrules do their best in shady and others in sunny places; some will not grow at all in a sandy soil; while others will succeed only with wet feet. A knowledge and appreciation of all these facts is necessary for the successful arrangement of the details of outdoor art. As the public comes to know these facts. there is an increasing demand for to services of the landscape architect

Making a Landscape Architect.

The work of the landscape architect is complex. To anke it it is successione must first love outdoor work. He must have an eye for the artistic in nature, for landscape gardening consists in the making of low scenery along natural and artitle lines. Nature is the great example from which we copy. He should have a scendific clueation wherein general agriculture, bertfeldlure, entomology and soil

thysics are the lending subjects. 111 his college course he should also receive particular instruction in surveying, mechanical and free-hand drawing. After completing a college course of this character, the future landscape architect should spend one two years at some large nursery where ornamentals are made a specialty in order that he may become familrar with the leading flowers and shrubs used in the landscape work, He should then spend a full year as an undergardener upon a country estate or at a botanic garden. Here he will receive practical training in the care and management of such places, in proming, spraying, the management of greenhouses, the care of potted plants, and the thousand and one other lessons in this line which only experience can teach. Then after two years' association with a good landscape architect, where experience may be had in the making of the planting plans and the planting out from his own plans, the young landscape architect may fairly hope to make a success of his chosen profession.

One engaged in this work, however, must not lag. Each new job is a new problem unlike any he has ever had before. There can be no dupilication. The planting arrangement which will make one place beautiful will produce anything but a pleasing effect upon another. The circumstances of soil, chunatic surroundings all require study in order to obtain best results. New varieties of plants are being constantly introduced and one must know these thoroughly in order to make use of any which prove hardy and acceptable.

Class of Executed Work.

There is a general lack of knowledge as to what constitutes the work of a landscape architect. In order to more fully illustrate just what this work is, tell us take an actual case now in hand and trace the various steps in the development of a country estate.

Some years ago I received a from a gentleman who stated he had heard of me through a friend. He stated that he had eighty agres of land which he desired to make into a farm with a ten-acre apide orchard, and upon which he expected to live himself for nine months of the year. He inquired as to my methods of business and terms, past work and experience, and engaged me to make the plans and develop his estate. With this client, I visited the place and selected the proper location for the house, the farm cuttige, barn, garden and orchard Upon one side and near the front of the farm occurs a low, marshy place, and here I advised the formation of an ortificial lake. From a topographical survey I have now prepared a planting plan of the whole place, showing the location of the building, walks, drives, onchard, kitchen garden, bake, trees and shrubbery. The apple orchard, tices, evergreens and most of the shinks will be planted out in the next Irw weeks. During the coming summer the walks and drives will be laid out, the artificial lake formed, and the house and other buildings erected. Next fall the planting around the buildings and the lake will be put out, so that when the house is occupied a year hence, the trees and shrubs will have been placted long enough to give the whole a reasonably home-like ap-

The Charge for Services,

pearance.

Landscape architects differ so widely in the charge made for their services that only a general statement on this subject can be made. Some work on a per diem basis. The charge, however, will vary according to the amount of study necessary in the development of each place. The charge for the planting plan is usually a stated sum, depending upon the amount of field work necessary in the location of the existing trees and shrubbery. The charge for the plan, however, is often at a given amount per acre.

Occasionally the work of the landscape architect may end with the making of the planting plan, but in most cases he also supervises the planting out of the nursery and this work is generally undertaken on a per diem basis. Each landscape architect has a number of competent foremen who do the planting out. As the season for this work lasts only for six weeks in the fall and eight weeks in the spring. it cannot be expected that the landscape architet will personally supervise the planting out. As he will have many jobs on hand at different places. he will do well if he gets around to see every job two or three times a week during the planting out of the nursery stock

Value of Confidence.

It is unfortunate that there are at the present time so many men engaged in the work of planting trees and shrubs who are entirely without training and whose knowledge of non-erv stock is limited to the names of a few flowers. These gardeners can necessarily see no professional sale to their work. Lacking any artistic training or appreciation of the beautiful they look upon their work simply as a business proposition. Too often this may be said of purserymen who attempt to do landscape work. The time is coming when a discriminating public will be very careful into whose hands they place the making of their surrounding landscape. The average estate owner knows practically nothing about trees and shrubs and has no means knowing whether his landscape architect is giving him his money's worth ur holding him up. The landscape architect should thus he selected with considerable (are and one should be confident not only of his ability but of his business integrity. Personally, I always talk over the full situation with my clients and where they are not limited as to means I like them to say: "Develop my place as you think best," or where they feel like they can afford to spend only a certain amount. I like for them to tell me to "Do what you can for this sum." I then feel that it is up to me to do my best, well knowing that a pleased client is my best adertisement. One job well done, involvlog only a reasonable expenditure has often led to a dozen others.

Planting Trees.

A planting plan consists of a medrawn to a scale showing the localithereon of just what trees shrubs and flowers are to be planted. The plan orry have thereon the name of trees and groups of shrubbery, or may contain numbers which refer to a planting list giving a key to the numbers. In this way we are able to tell somewhat as to how a place wid look when planted out. We also have a list of the nursery stock to be used in the planting and we can thus know what the whole will cost. We thus see why even a small place should be planted from a planting plan. We then know before the work is begun what is to be done and its cost.

The nursery stock is ordered by the landscape architect, generally from valuations nurseries, depending agon where the best stock of the different varieties, can be obtained for the money. The landscape architect should make it his business to keep in touch with the stock of all the nurseries, pasting stocks of all the nurseries, pasting stocks and annual visit. In this way he is able to save his clients considerable in the save his clients considerable in the purchase of the nursery stock and especially to guird against the shipment of small or poorly grown stock.

Some General Principles.

There are many objects to be comsidered in landscape work. Except in what is known as formal cardening waaim to imitate nature as far as possible; the object being to produce a pleasing scene of grace and beauty restful to the eye. This is best done by planting the flowers and shrubs in masses, by having many plants of the same variety together. We aim to produce a mass effect of foliage flower, and an individual plant will not give this effect. It is generally best to have an open center lawn with plantings of flowers and shrubs along the border lines with a sky-line of trees. This will give the effect of increasing the area of a place even on a city lot. The shrubbery groups should be so arranged that all of a place doenot appear from any one point of view thus giving the appearance of "more beyond." Except in extreme formal gardening a building should have a few shrubs planted close against its foundations in order to make it appear as a part of its surroundings idence grounds especially it is important that a few shrubs be planted just next to the front porch. The varieties to be used will depend upon the height of the norch.

After Supervision.

It should be understood that an attractive tandscape cannot be made in a day. It must be a thing of growth, It takes time for the flowers, shrubs and trees to become full grown and attain their full perfection. It is thus important that the landscape archited should supervise the after-care of a place. He will then notice spots which need a rounding out of the masses of shrubbery or places wherein the planting of a few additional flowers will bring a color scheme into perfect hormony. He can then see that the trees and shrubs are properly pruned to remove dead wood or to keep the flowering shrubs in a young and vizorous growth that they may produce a maxinum of flowers. Insects and plant diseases at time play havor with some plants, and if the lands are architect place under supervision, ac cao me gardener instructions as to prevent these enemies.

AN INVESTIGATION OF QUANTITY SURVEYING.

Uniticism of Architect, Business Brigandry, Cost of Estimating, and Answers.

Sullivan W. Jones, **

From the Pacific Buthler and Engineer. Much justification but, under the exthing difficult conditions of practice, uninst criticism has been directed against the architect for the general debriency and obscurity of the drawmas and specifications he issues for the purpose of estimate. The essential tunction of the drawings and specificahond in the contract is to define and soul the character and amount of work to be included in the bid and the subsequent contract, with such precision and clearness that they are capable of only one definite interpretation. Their failure to do function, with the consequent injection into the situntion of many elements of uncertainis transforms competitive hidding unto reckless gambling with quantities of labor and materials, and with the inture chances of recouping possible and probable losses through securing mordinate profitable extras and through the sandbagging of the subcontinuetors

The Fate of Competitive Hidding,

Competitive hidding is fast degenerating into a discrateful scramble from with the contractor who will take the longest chances generally emerges as to escessful bidder. These conditions are undermining the contractor's monal stanting and are fostering and secondaring business brigandry in the field of building instead of honesty and ethology.

We are all more or less familiar with the manifestations of this form of decolence, and indeed we are all it increasingly more difhealt to secure thoroughly honest work under the lump sum con-tract awarded through competitive building. Some architects, and the number is constantly increasing, have tried the cure of eliminating the general contractor, and have succeeded in overcoming at least a part of the trouble. But this treatment alleviates the symptoms only; it does not reach the roots of the evil. We now face a atuation demanding that a sound and positive basis be provided for fair and equitable competitive bidding with war a honesty, ingenuity, knowledge and efficiency shall be the factors of

In approaching a discussion of the committee of competitive bidding under existing conditions, we have merely scratched the surface of a subject of vest proportions and far reaching in 45 antimate relation to the whole question of the high cost of building and to certain contributing causes of the (22) cost of living.

The Cost of Estimating.

The cost of estimating to the general contractor and his sub-contrac-

tors collectively, according to statistics compiled upon data collected from a great number of contractors in all of the trades, is slightly over 1 per cent of the amount of the estimate. is a wide variation between the costs contractors. Some have kept careful cost data and others have not. The resuft given is obtained by fixing the average cost in each trade expressed as a percentage of the value of the work under the trade, and reducing this average to a percentage of the cost of the entire work. To illustrate. We find that there is an average of nine bidders on structural steel. The average cost of estimating structural steel is one-sixth of one per cent of the amount of the estimate. Therefore the total cost of estimating the strucinfal steel for one building is nine times one-sixth per cent. or 0114 and one-half per cent of the value of the steel. The structural steel item averages about ten per cent of the cost of the building, and the cost of estimating the steel expressed as a percentage of the cost of the building would, therefore, be ten per cent of one and one-balf per cent or fifteen one-hundredths per cent. A similar extension is made for each trade and allowances are then made for the submission of estimate- by the same subcontractors to a number of the general contractors bidding, which is usual There is an average of ten bods taken on each building and each contractor receives an average of seven sub-bids in each trade. Re-estimating is frequently resorted to, but no consideration has been given to this further source of waste in computing the net

The general contractor usually of quates the mason work and rough carpentry, and occasionally the plastering and the erection of structural steel. But even if the general contractor is eliminated, to situation does not change for the same duplication of the work of estimating then occurs in the trades usually bandled

The cost to the contractor of all estimates is charged to "overhead" and must eventually be distributed pro-rate over the cost of work actually secuted and executed. Under the law of averages each contractor secures one of every ten jobs on which he submits tenders. The accuracy of this reasoning is verified by the statement secured from various contractors It therefore becomes evident that cach owner mays the cost of estimating ten jobs of the same value as his own in nine of which be has not the slightest interest. In other words, 10 per cent of the amounts of all estimates represents estimating cost under the mefficient methods now employed. L'ouversely, it is evident that by doing away with the duplication of the work of estimating, and allowing for the sake of argument 3 per cent of the cost of the work for the preparation of complete bills of quantities and estimating data and the cost to the bidders of pricing such bills we may certainly effect a reduction of 7 per cent in the cost of building generally. This reduction expressed in dollars reaches the appalling figure of \$51000,000.00 for the United States for the year 1912, and

this figure is safely conservative. This loss is suffered on the one item of estimating. An equal, if not greater. amount is lost to the owner annually as the result of illegitimate profits accruing to the contractor through inordinate extras, substitutions and evasions made possible by hasing the contract on loose and deficient drawings and specifications. A further loss results from accumulated interest charges on payments improperly withheld both from the general contractor and from the sub-contractor.

All losses must ultimately be absorbed by the business and offset by the profits. The losses above enumerated are therefore charged against the building. The effect of this super cost are accumulative; rents and taxes are increased correspondingly, and the increase is paid year after year until the accumulated aggregate loss passes into figures outside the sphere human comprehension.

Reflecting upon these conditions, we reach the conclusion that the duplication of work in estimating should be done away with by adopting the system of estimating on bills of quantities prepared and issued with the drawings and specifications, and that the bill of quantities be made the basis of the contract. We believe the owner should pay the cost of preparing the bills of quantities and that he should assume responsibility for their accuracy

Asswers to Objections.

In connection with the expression of these beliefs, we would briefly answer the objections which are usually raised against them. The owner's objection to being asked to pay the quantity surveyor's fee is completely satisfied by the statements on the actual money wasted resulting from the present method. By making this further direct payment, the owner actually saves a very considerable amount and is assured of receiving full value for money The objection to the owner's assuming responsibility for the bill of quantities is met by submitting that a bill of quantities prepared by a comnetent surveyor in free and interested co-operation with the architect can only result in the production of a complete bill and of drawings and specifications closely approaching perfection. All questions as to the true intent and meaning of the drawings and specifications will arise before hids are taken. instead of after the contract is let as is now the case. Furthermore, the length of the quantity surveyor's businers life will depend entirely upon the accuracy with which he does his work and with which his bills co-ordinate with the drawings and specifications in the construction of the work. It will he incumbent upon the quantity surveyor to see to it that not only lils bills but also the drawings and specifications are clear and complete before issue. We believe that the quantity surveyor in this country must be an organization composed of experts in This will overcome the each trade objection that much valuable time would be lost in preparing the bills.

The determination of the most expedient method of procedure for inaugurating such a radical change is an extremely difficult problem, and we are

not prepared at this time to make any definite proposals. We believe the establishment of uniform standards and rules for the measurement of materials incorporated in the structure is a condition precedent and essential to the successful operation of the system in this country; thus avoid confusion such as results in England from the use of three standards or systems.

*Abstract of report of the committee of the American Institute of Architects on quantity surveying.

*Architect and chairman of the committee, which included Leon Coquard and C. L. Borie, Jr., The Octagon, Washington, D. C.

THE LIES OF THE PARMEN.

From the Country Gentleman.

I think that the life of a husbandman of all others is the most delectable. It is honorable, it is amusing, and, with judicious management, it is profitable.

In indulging these feelings, I am led to reflect how much more delightful to the undebauched mind is the task of making improvements on the earth than all the vainglory that can be acquired from ravaging it by the most uninterrupted career of conquest.

I know of no pursuit in which more real and important service can be rendered to any country than by improving its agriculture, its breeds of useful animals, and other branches of a husbandman's care.

MODEL OF PANAMA CANAL IN CANADA An interesting and instructive model

of the Panama Canal, on exhibition at one of the large department stores in Vancouver, is attracting much attention. The model, which is constructed of wood and papier-mache, shows the system of lifting ships to a sufficient height to overcome the difference in the level of the waters of the Atlantic and Pacific Oceans. Pictures of the model appear in the local papers and photographs of the same are being distributed. Large crowds are attracted dally to the exhibit, which has caused much comment, resulting in a more general and intimate knowledge of the great work than could be gained from reading descriptions of the canal. The inspector of the Vancouver public schools has been so impressed with the educational value of this working model that an arrangement has been made permitting the pupils to take the time during school hours to visit the exhibition.

The rights for exhibiting the model are controlled in Portland, Ore., and the Vancouver company making the display have been six months negoliating for the privilege of placing the plan on exhibition in this city.

A Face We All Love.

There are faces we love and faces we hate.

And some that would make you holler,

But the face worth while And that makes you smile is the face on the silver dollar.

-Jacksonville Times-Union

Firms desiring news on special classes of buildings, such as Banks, Churches, Schools, Hotels, etc., will find such Items all classified and grouped under proper headings, commeacing on this page. These same Items are again repeated under "LOCALITIES" in the last part of our news deportment

APARTMENT HOUSES.

SAN FRANCISCO-Apartment house, 3 story and base, frame, \$25,000, Architect, Frederick H. Meyer, Bankers' Investment Bldg., S. F. Owner, Mrs. Bertha Overfeld. The building will be erected at the corner of Fillmore and Green streets, and will cover a considerable ground area. Interior bas been arranged for a number of three and four room suites, all of which will have private bath and wall beds. Interior finish will be of pine and hardwood veneer. There will be steam heat, portable vacuum cleaners and a hat water system. Bath rooms will be finished in tile and will have composition floors. Entrance will be finished in marble and tile. Exterior of the building will be covered with cement plaster on metal lath. A pressed brick veneer base will be used. Plans are complete and figures are being taken.

SAN FRANCISCO-Apartment house. 3 story and base, frame, \$10,000, Architect, Edward E. Young, 251 Kearny street, S. F. Owner, Herman Hogrefe The building will be erected on the west side of Hyde street north of Pine, baving a frontage of 25 feet and a depth of 64 feet. There will be a total of six suites arranged in two and three rnoms with private baths and wall beds. Interior finish will be of pine and redwood. Hardwood floors will be used in the living rooms. There will he steam heat and a hot water supply, Bath rooms will have tile wainscot and composition floors. Entrance will be finished in marble and tile. Exterior will be covered with cement plaster on metal lath and shiplap. Plans are complete and in the bands of the owner who will do the work by Day Labor. Materials are now being purchased.

SAN FRANCISCO-Apartment house, 5 story and base, brick and steel, \$69,-500. Architect, Herman Barth, 12 Geary street, S. F. Owners, Katz Estate. The building will be erected at the northwest corner of California and Hyde streets, covering an area of 87 feet 4 inches by 78 feet 8 inches There will be 36 apartments of two and three rooms and a store. Interior finish will be of pine and elm. Hardwood floors will be used in the halls and living rooms. Plans provide for steam beat, elevator service, a hot water supply and vacuum cleaning plant. rooms will have tile wainscot and composition floors. All suites will be equipped with wall beds and will bave private bath rooms. Entrance will be finished in marble and tile. Exterior of the building will be faced with pressed brick. Plans are complete and figures are being taken.

SAN FRANCISCO-Apartment house, 5 story and base, brick and steel. Cost not stated. Architects, Rousseau Rousseau, Monadnock Bldg., S F Owners, Metropolis Investment building will be erected at the northwest corner of Sacramento and Hyde streets, covering a considerable ground Interior has been arranged for a total of nine suites of five rooms and bath each. Interior finish will be of pine and hardwood veners with ord floors in the principal rooms. There will be steam heat, elevator service vacuum cleaning system and but water supply. Entrance will be unished in tile and marble. All bath tooms will have tile wainscot and composition floors. Exterior of the building will be faced with pressed brick are being prepared. SEATTLE WASH - Apartment

house, 3 story and base, brick and

steel, \$30,000. Architects, Thompson &

Thompson, Mutual Life Bldg, Seatth Owner, S. A. Martin The building will be erected on Republican street covering an area of 41 by 83 feet. There will be a number of two and three room suites with wall heds and provate bath rooms. Interior finish will be of bine and hardwood veneer Plans provide for steam heat and a hot water supply. All bath rooms will have tild wainscot and composition floors trance will be finished in tile and marble. Exterior of the building will be fuced with pressed brick Plans are complete and in the hands of the own er who will do the work by Day Labor ORE. - Apartment PORTLAND. house, 4 story and base, brick and steel, \$50,000, Architects Claussen & Claussen, Macleay Bldg., Portland Owner, C. C. Brown. The building will be erected on Madison between Broadway and Park street, with a frontage of 50 feet and a depth of 100 feet Plans show a total of 34 suites of three and four rooms each with bath and wall beds. Interior finish will be of pine and hardwood veneer. There was be steam heat, elevator service, vacuum cleaning and a hot water supply All bath rooms will have tile wainscor and composition floors. Maride and tile will be used in the entrance. terior of the building will be faced with pressed brick. Plans are complete and figures are now being taken OAKLAND, CAL-Apartment house

LOS ANGELES, CAL - Warehouse,
4 story and base, brick and steel, \$42,-1990. Architects, Morgan, Walls & Morgan, Van Nuvs Eldg , L. A Owner, Mrs. S. H. Van Novs Contractors, Alta Planing Mill, 830 McGarry Street, L. A. Contract price, \$40,000

GARAGES.

OAKLAND, CAL-Garage, 2 story and base, reinforced concrete, \$30,000, Architect, Charles W. McCall, Central Bank Bidg, Oakland, Owner, Dr. The building will be Huntington errected on the west side of Broadway north of 19th street, and has been designed for a large commercial garage. There will be office space, storage rooms and a completely equipped machine shop included. Interior finish will be of pine. Concrete walls, floors and roof slabs are specified. Plans provide for metal window sash and frames and special gasoline storage tanks. Interior of the building will be faced with cement plaster. Plans are complete and figures are being taken.

DAKLAND, CAL-Garage, 2 story Cost not and base, brick and steel. stated, Architect, Charles W. McCall. Central Bank Bldg., Cakland Owners, Imperial Garage and Supply Co. The building, which has been mentioned here before, will be erected on the east side of Franklin street north of 14th street, covering a considerable ground area. Interna will be finished in pine. Plans provide for a sales department and storage space. There will be cement floors. Plans provide for metal window sash and frames and special gasoline storage tanks, terior of the building will be faced with pressed brick. Plans are com-plete and figures are now being taken.

GOVERNMENT WORK AND SUPPLIES.

Earthwork.

The Reclamation Service is asking for proposals for earthwork on 36 miles of main canal, Grand Valley irrigation project, Colo., involving the excavation of approximately 1.900.000 cubic yards of material. This work is situated near the main line of the Denver and Rio Grande and the Colorado Mulland Railways in the vicinity of Palisade, Grand Junction, and Fruita, Colo. The hids will be opened after 2 oclock p. m. June 16, 1914, at the office of the Reclamation Service. Grand Junction, Colo.

Earthwork and Structures.

The U. S. Reclamation Service is asking for proposals for earthwork and structures, Dodson South Canal, Milk River orgination project Mont This work involves about 145,000 cubic yards of excavation, 2,650 cubic yards of reinforced concrete, the placing of 260,000 pounds of steel reinforcment and the placing in wooden structures of about 150,000 feet, B. M., of lumber It is situated on the south side of Milk ltiver in the vicinity of Malta, adjacent to the main line of the Great Northern Railway. Bids will be opened at the office of the Reclamation Service at Malta, Mont., after 2 o'clock p. m. June 10, 1914.

Tongue Point, Ore., Seawall.

The following bid was received by the Hight-house inspector, 17th district, Portland, Ore., for constructing, retaining, making fill, and placing riprap at Tongue Point light-house depot, near Astoria, Ore..

Stehniger Bros., Portland, Ore, \$7 .-

Paget Sound, Wash., Fireproof Huilding.

The following bids were received at the bureau of yards and docks, Navy Department, Washington, D. C., for fireproofing south end of building No. 59, navy yard, Puget Sound, Wash.;

Item 1, changes in building, complete; 2, deduct from item 1 for omltting new floor construction on ground

H. E. Doering, 567 Maple Portland, Ore., item 1, \$10,892.

Eckman & Mawet, Scattle, Wash., item 1, \$10,100; 2, \$1,500, Carlson & Son, Scattle, Wash., item

1, \$9,920; 2, \$1,715. Erikson & Larson, Scattle, Wash.,

item 1, \$9,440; 2, \$1,500. W. N. Concanon, 525 Market street,

San Francisco, Cal., item, 1, \$10,459; 2, \$1,354. John Galber, Seattle, Wash., item 1,

\$10,218, 2, \$1,870. Sundell & Coling, Northern Bank

Building, Seattle, Wash., item 1, \$9,-586,50, 2, \$825. Charles H Schaar, Scattle, Wash.,

item 1, \$9,000; 2, \$500.

Notice to Navy Contractors,

The attention of contractors is invited to the fact that no material delivered under contracts. bureaut orders, etc., will be received at the various navy yards unless the cases or other containers are properly marked with contract number, etc., so that the material can be readily identified.

Light-House Service Road

The following bids were received by the light-house inspector, 18th district San Francisco, Cal. for constructing a road to Point Arena light station, Cal.:

J. C. Halliday, Point Arena, Cal. \$2,490; accepted.

Wm. Lawson, Manchester, Cal., \$2,-

Sau Francisco, Cal., Interior Decoration.

The following bids were received by the supervising architect. Treasury Department, Washington, D. C., for interior decoration and painting of the U. S. post office at San Francisco. Cal.:

A. Lincoln Cooper, New York City, \$10,000; 11 weeks. Isidor P. Kissel, San Francisco, Cal.,

PANAMA - PACIFIC EXPOSI-TION WORK.

Exhibit of Steel Corporation.

The announcement is made that the United States Steel Corporation and its subsidiary companies propose to have a comprehensive exhibit of its operations at the Panama-Pacific Exposition in San Francisco in the year 1915. It will begin with the ore fields carry on an educative picture of its operations in ore mining, rail and water transportation, dock operations, coal, coke, and pig iron production, steel manufacturing in its various lines, and will also present in a materially displayed way the processes of manufacturing of many of its subsidiary companies' products, including "National" pipes; also how it utilizes its by-products and the display of many uses in which its general prodnets are employed, typifying the advancement in the uses of this country's resources.

In addition to the material exhibits before mentioned, the corporation intends to exhibit in a comprehensive manner by moving pictures its operations throughout all departments, showing the ramifications of the processes of the corporation's operations. It is proposed, as well, to set forth to the world the work which the United States Steel Corporation has done towards the social welfare of its employees and those depending upon them. Also it will exhibit many forms of safety devices that have been conceived by the corporation officials and its employees and in the installation of which large sums have been and

are being expended by the corporation. SAN FRANCISCO-Concession building, 1 story, frame and plaster. Cost not stated. Architect, Carl Werner, Phelan Bldg., S. F. Owners, The Neptune Amustment Co.
